Room for the web.

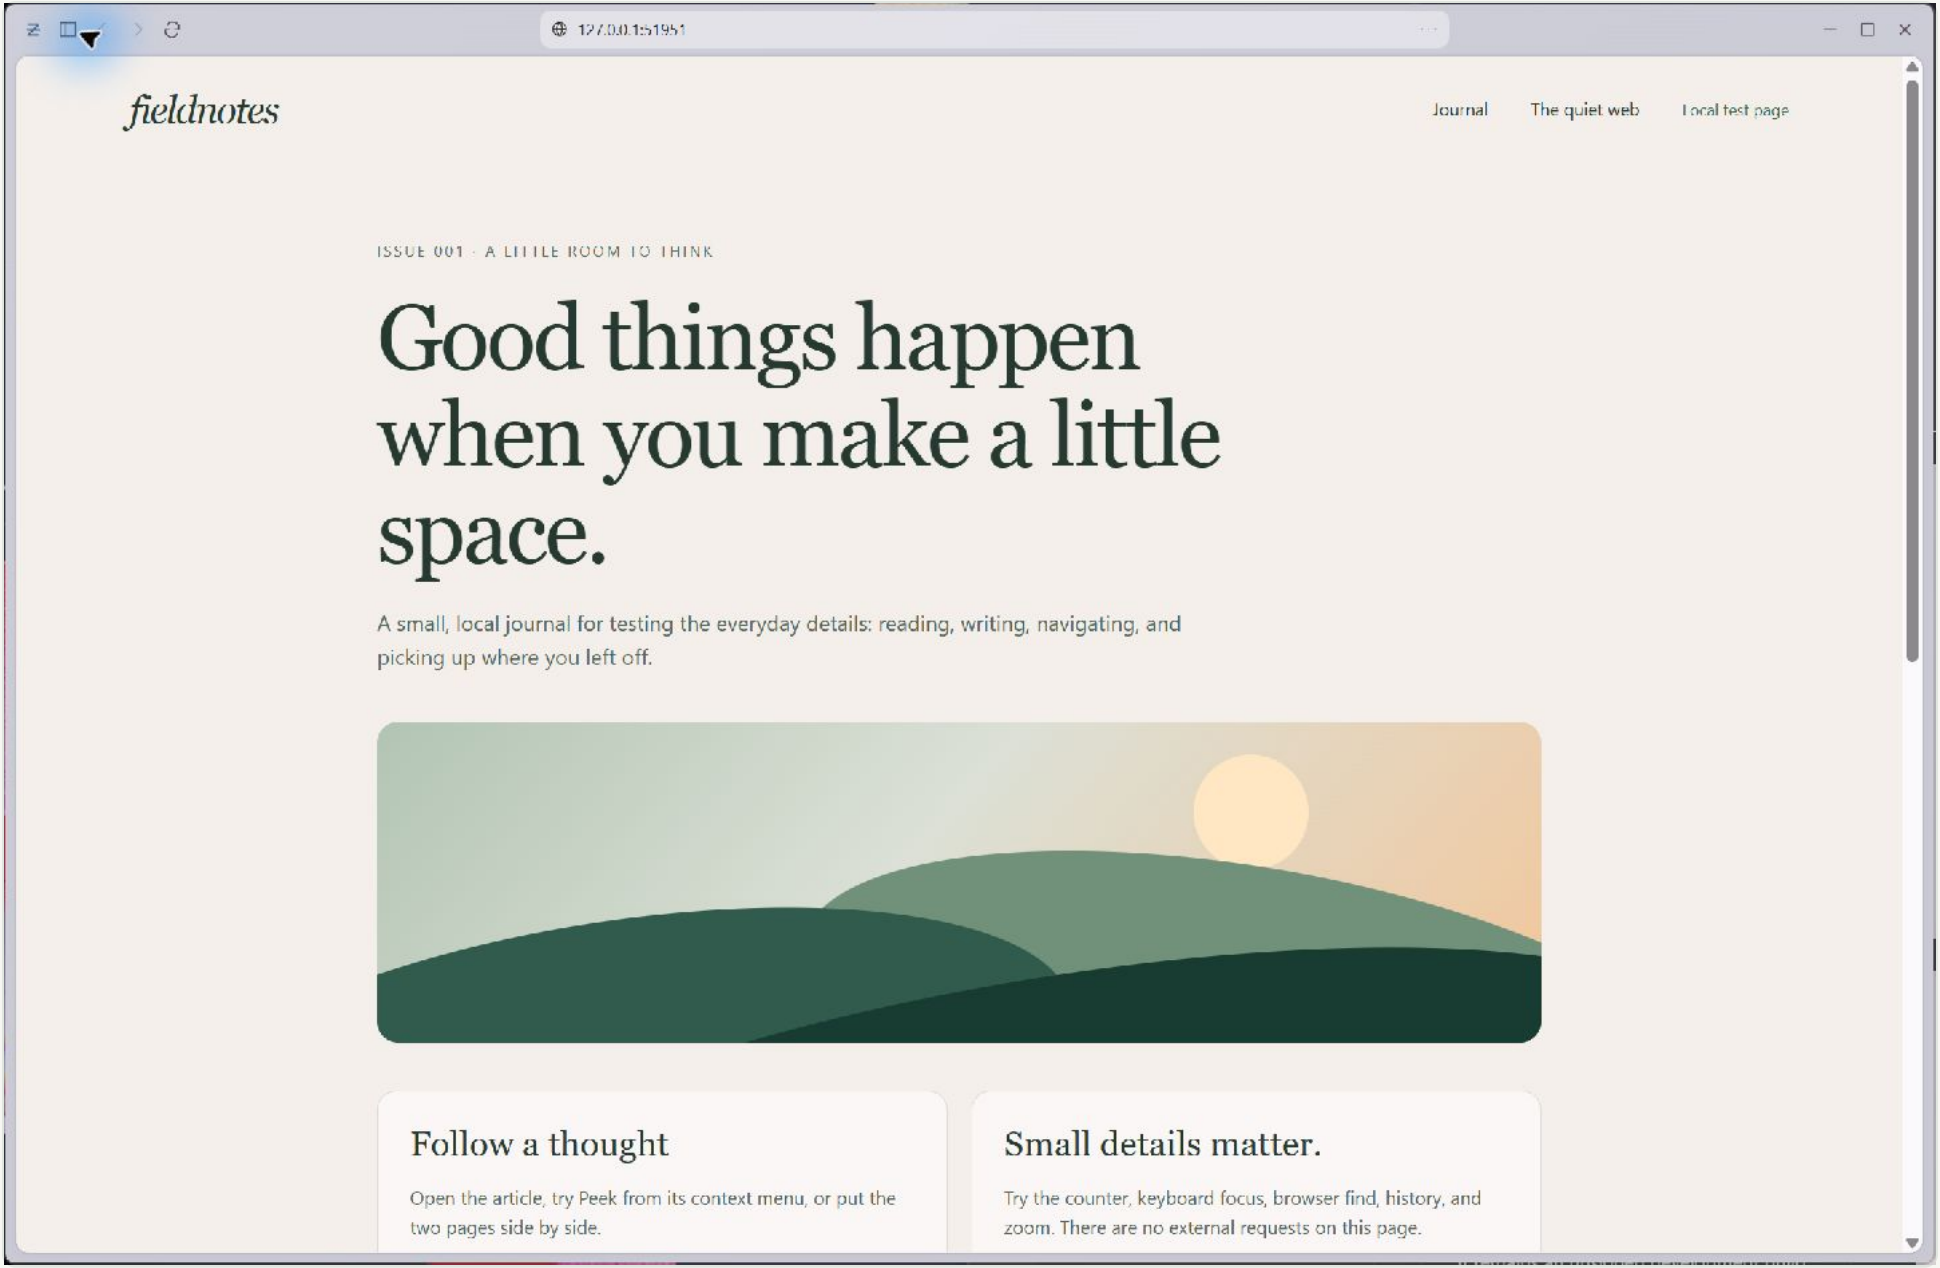

Navigation and the address field live in the sidebar. Icon favorites, folders and single-line tabs stay close; Library, Spaces and creation share a quiet footer.

Start with one thought.

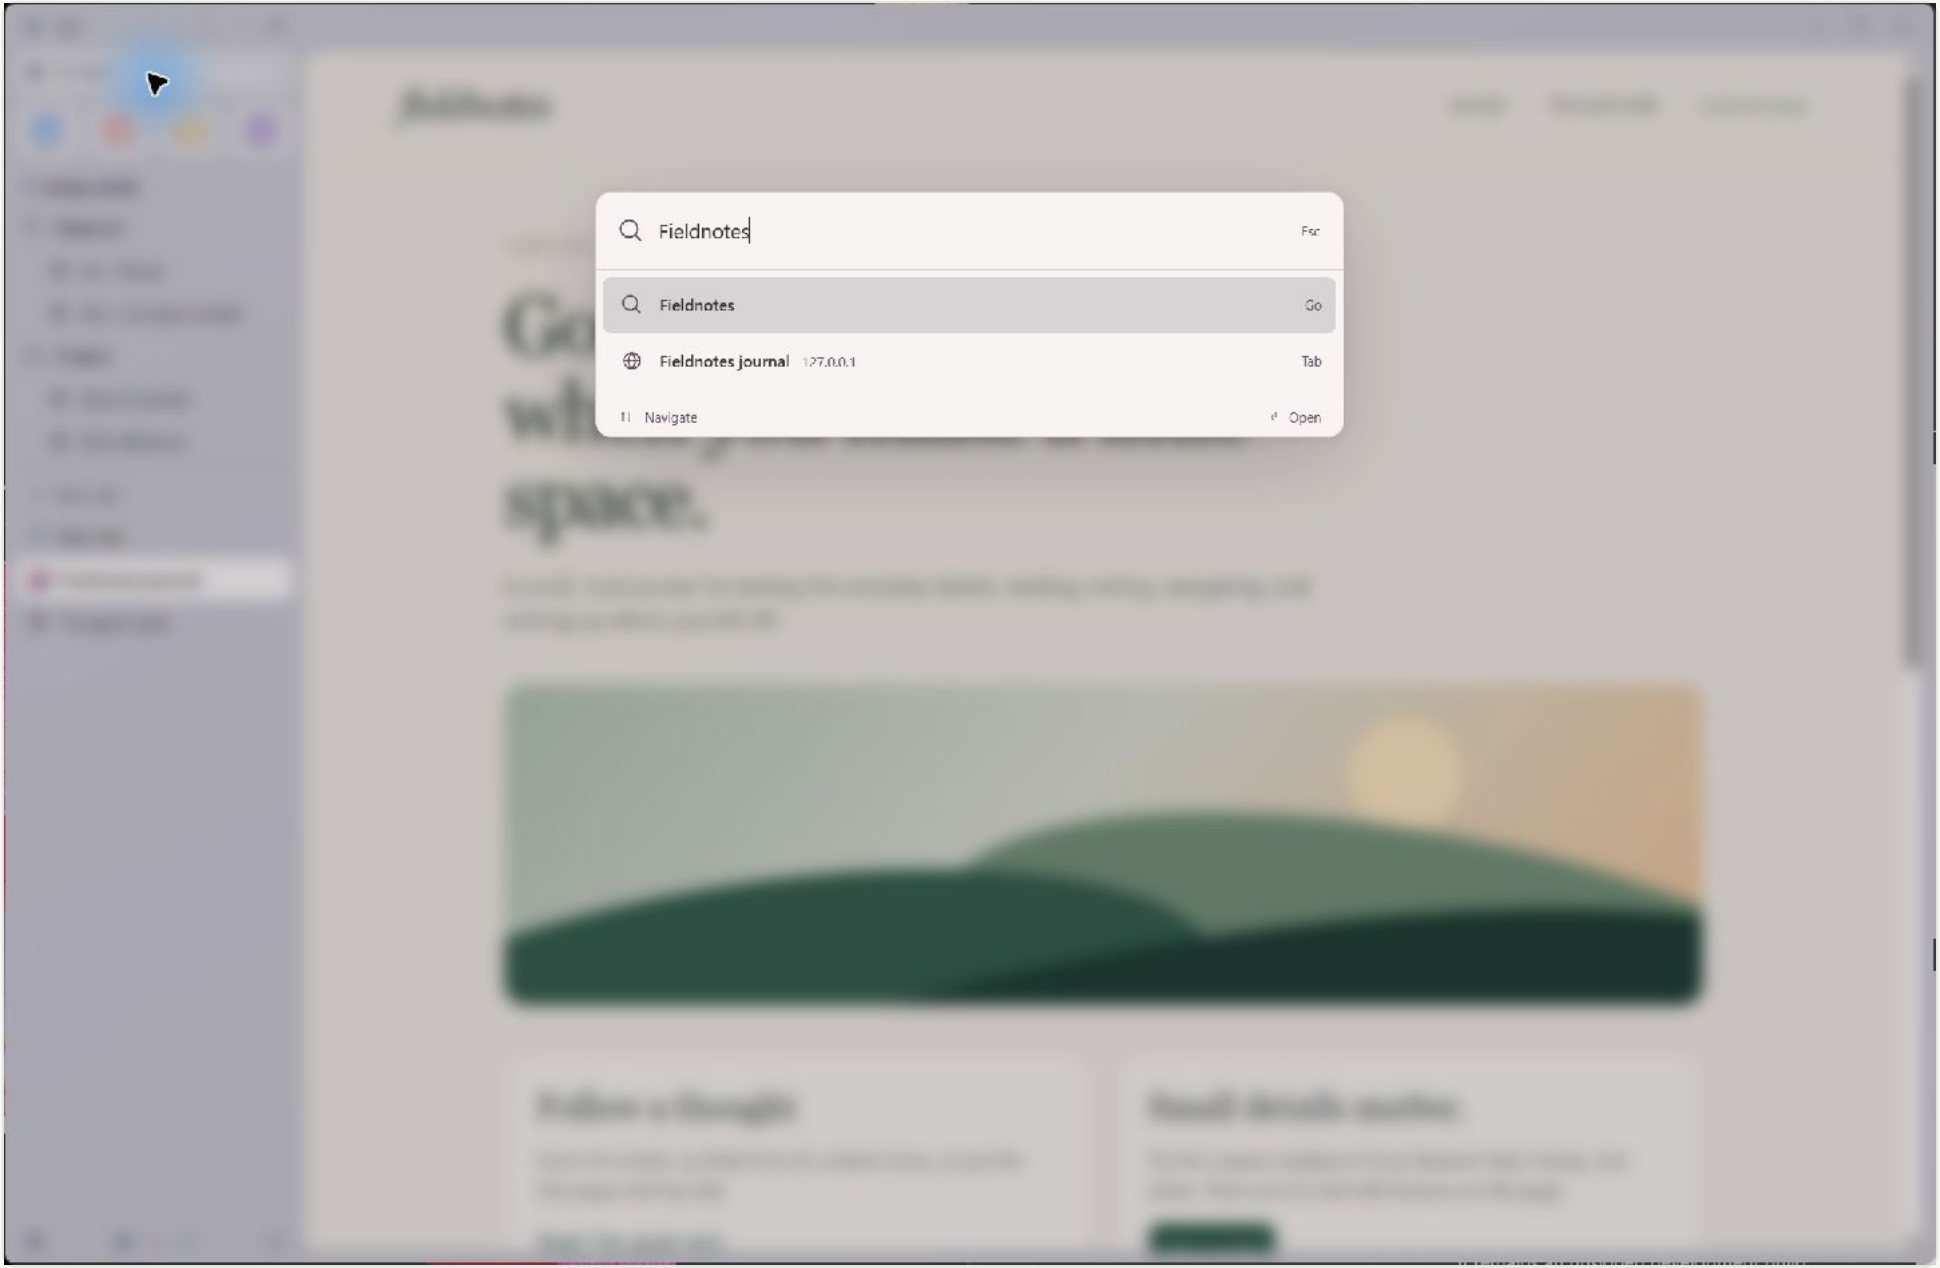

Search, saved destinations and recent pages. The new-tab page keeps familiar places nearby without repeating favorites already visible in the sidebar.

Give the page more room.

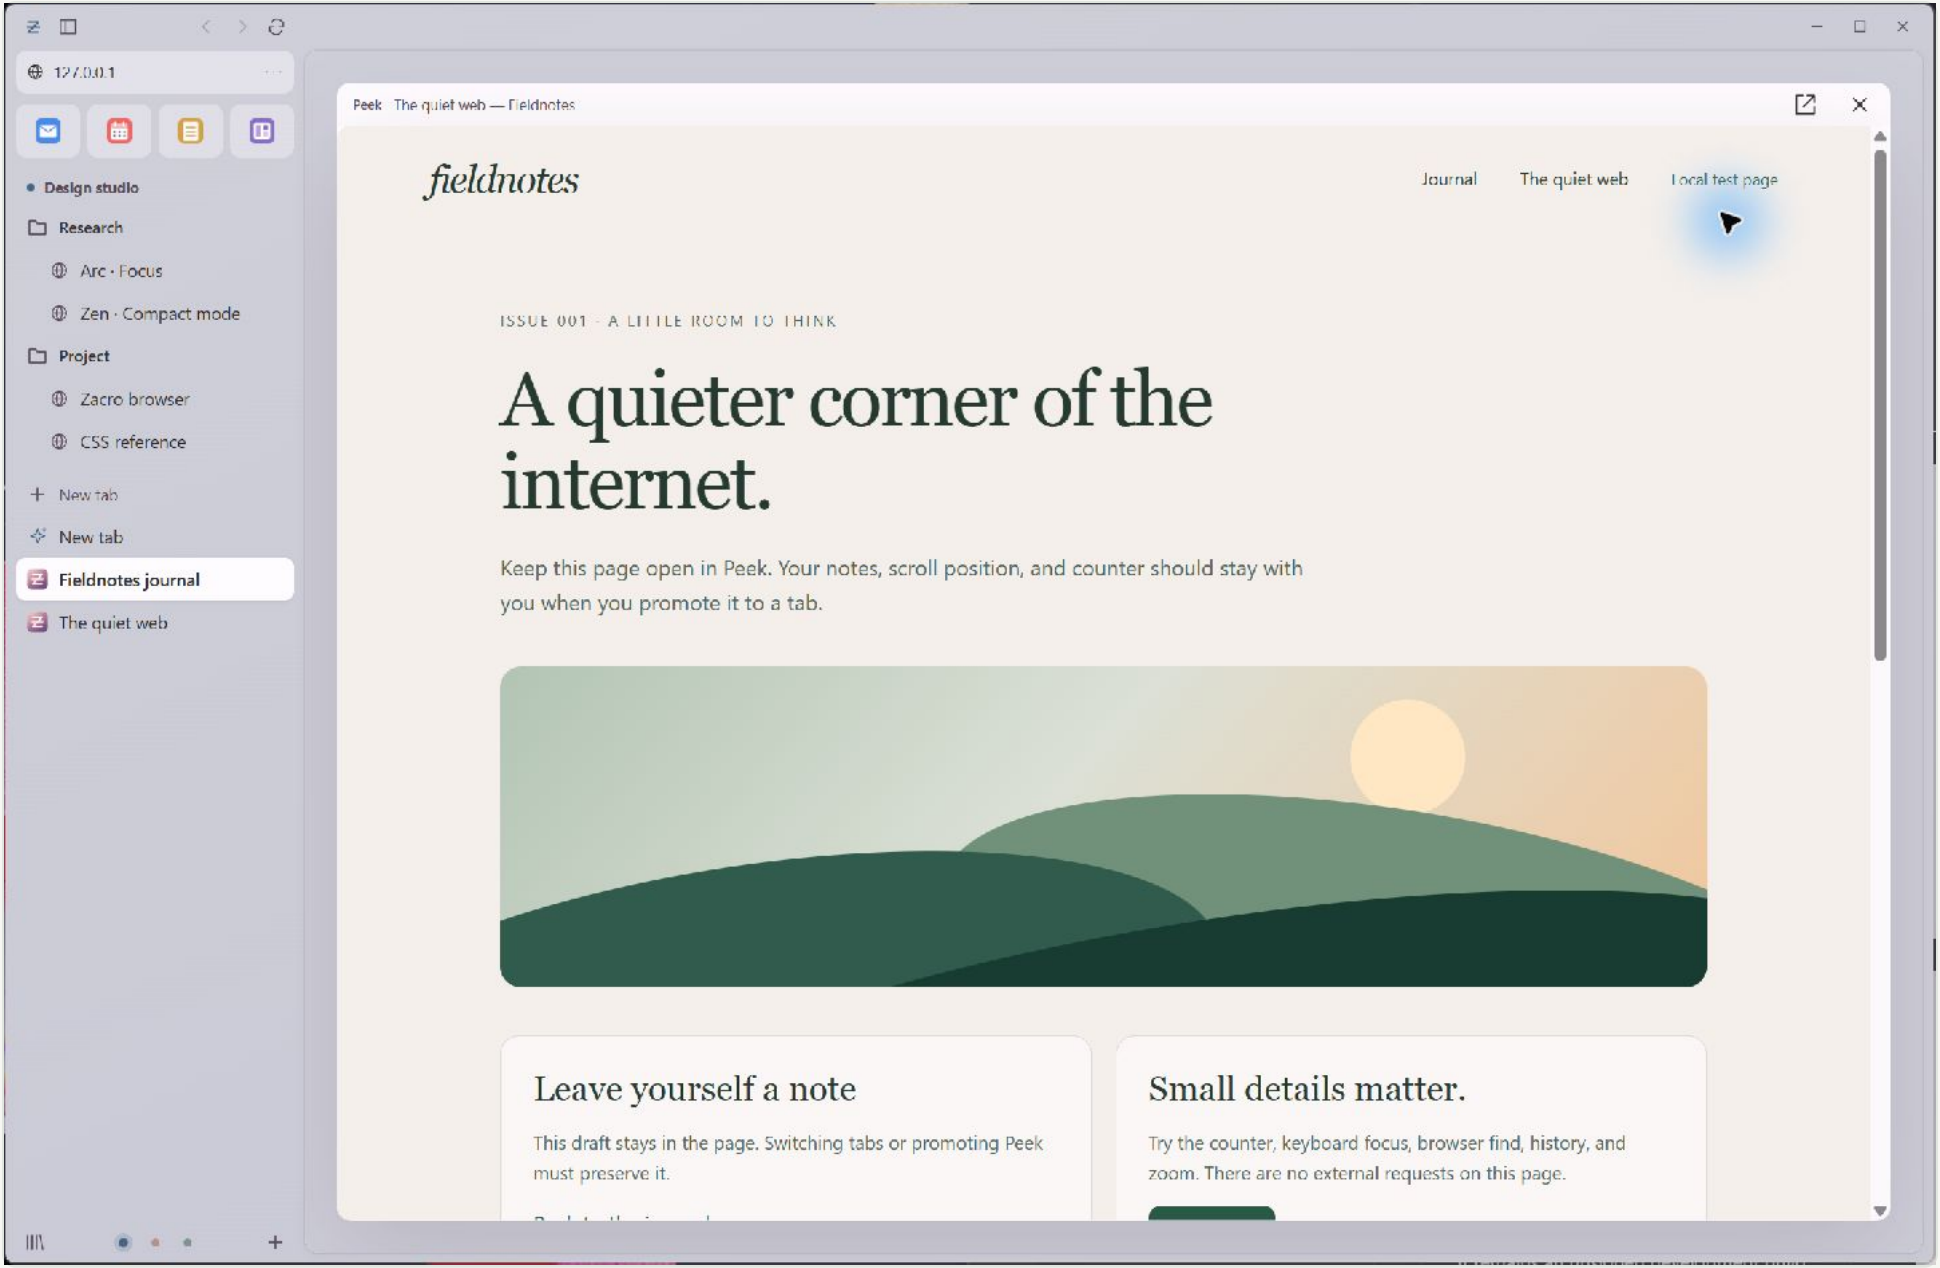

Ctrl/Command + Shift + B hides the sidebar without reloading the page. A compact navigation row keeps the address and sidebar toggle available.

Move at the speed of a shortcut.

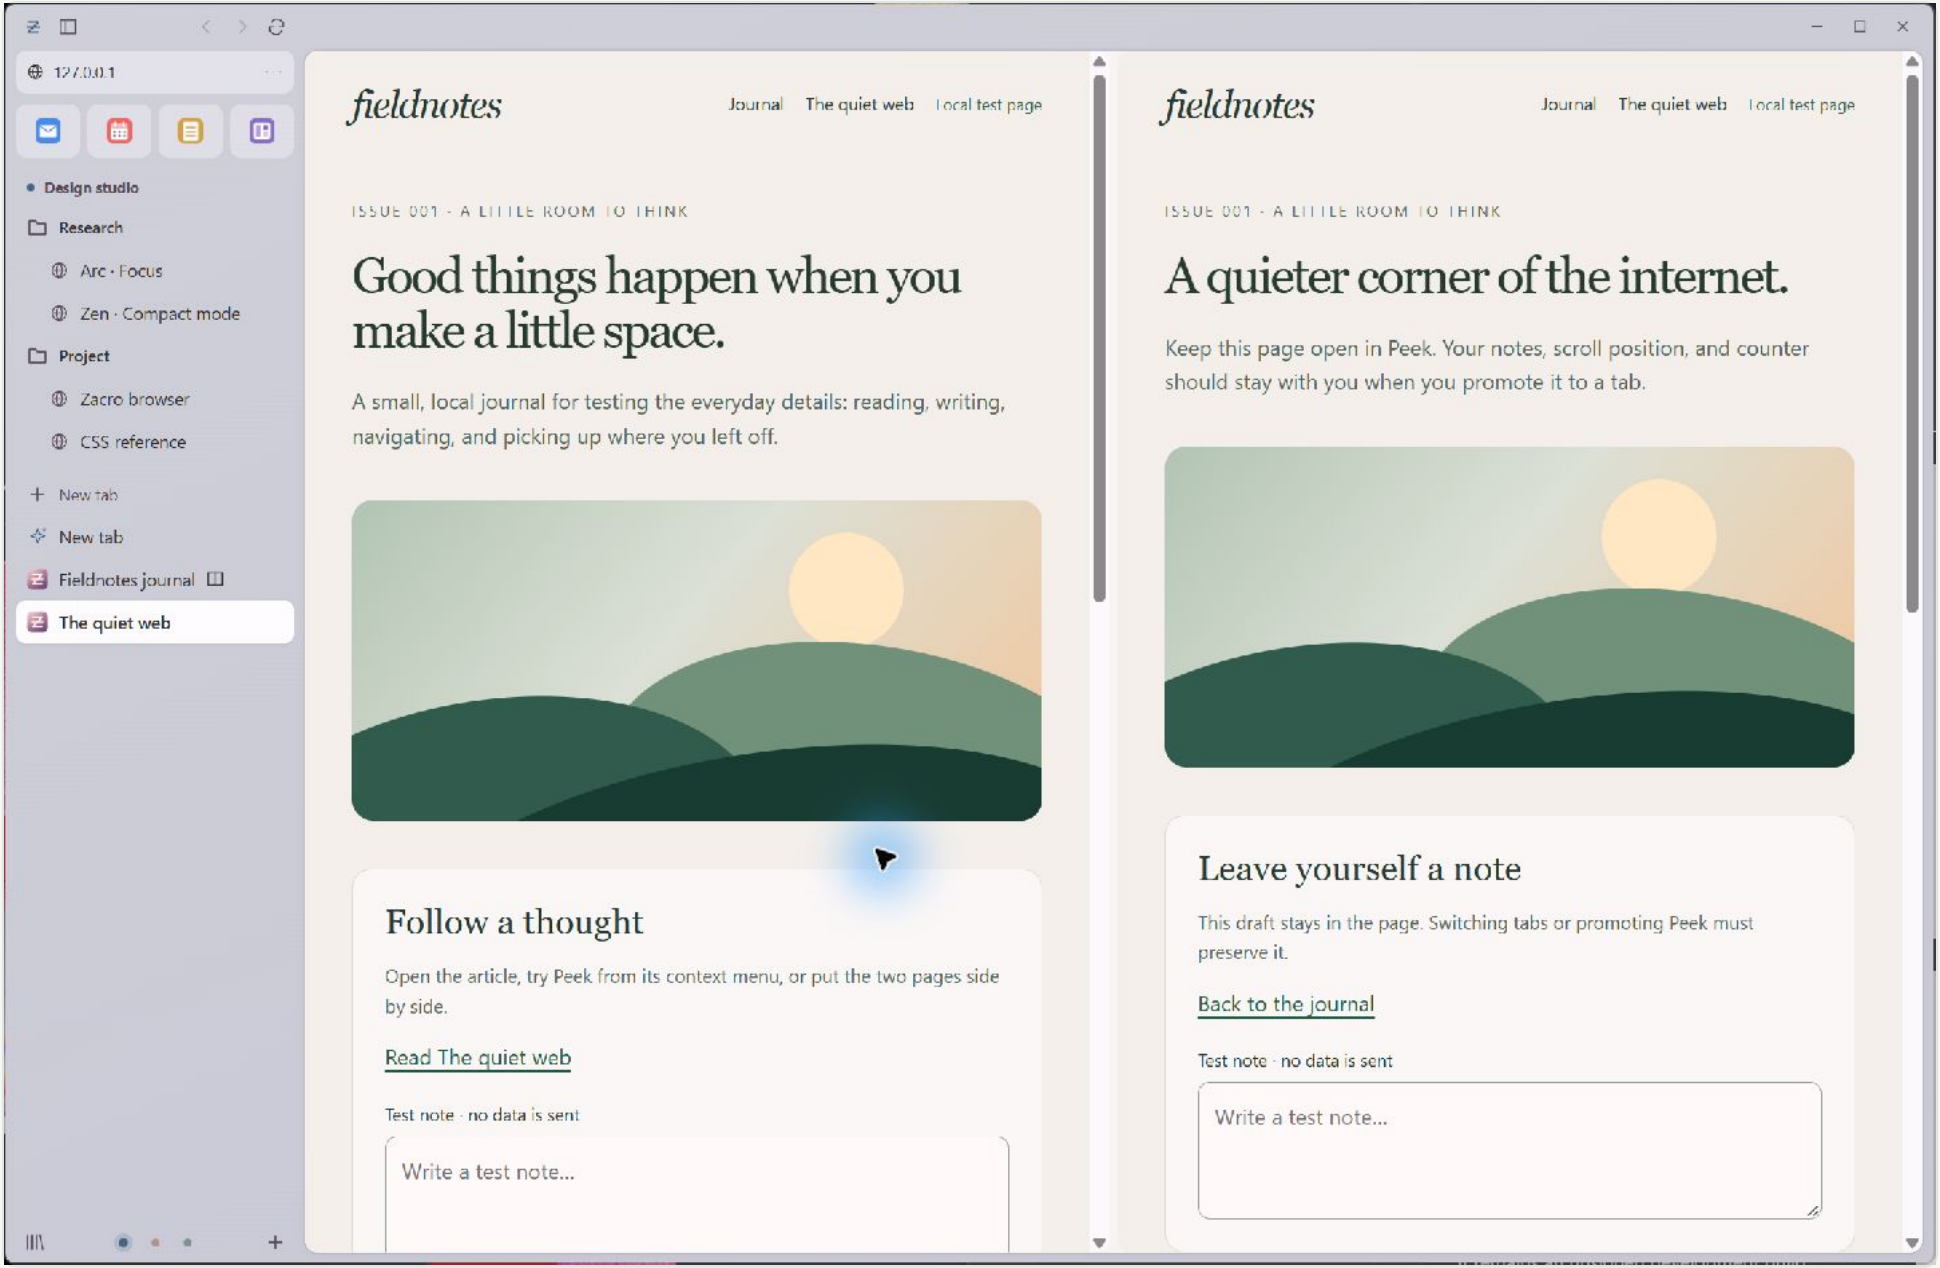

Ctrl/Command + L opens the command bar. Find a tab, enter an address, search the web or choose a browser action. Escape returns to the page.

Follow a link. Keep your place.

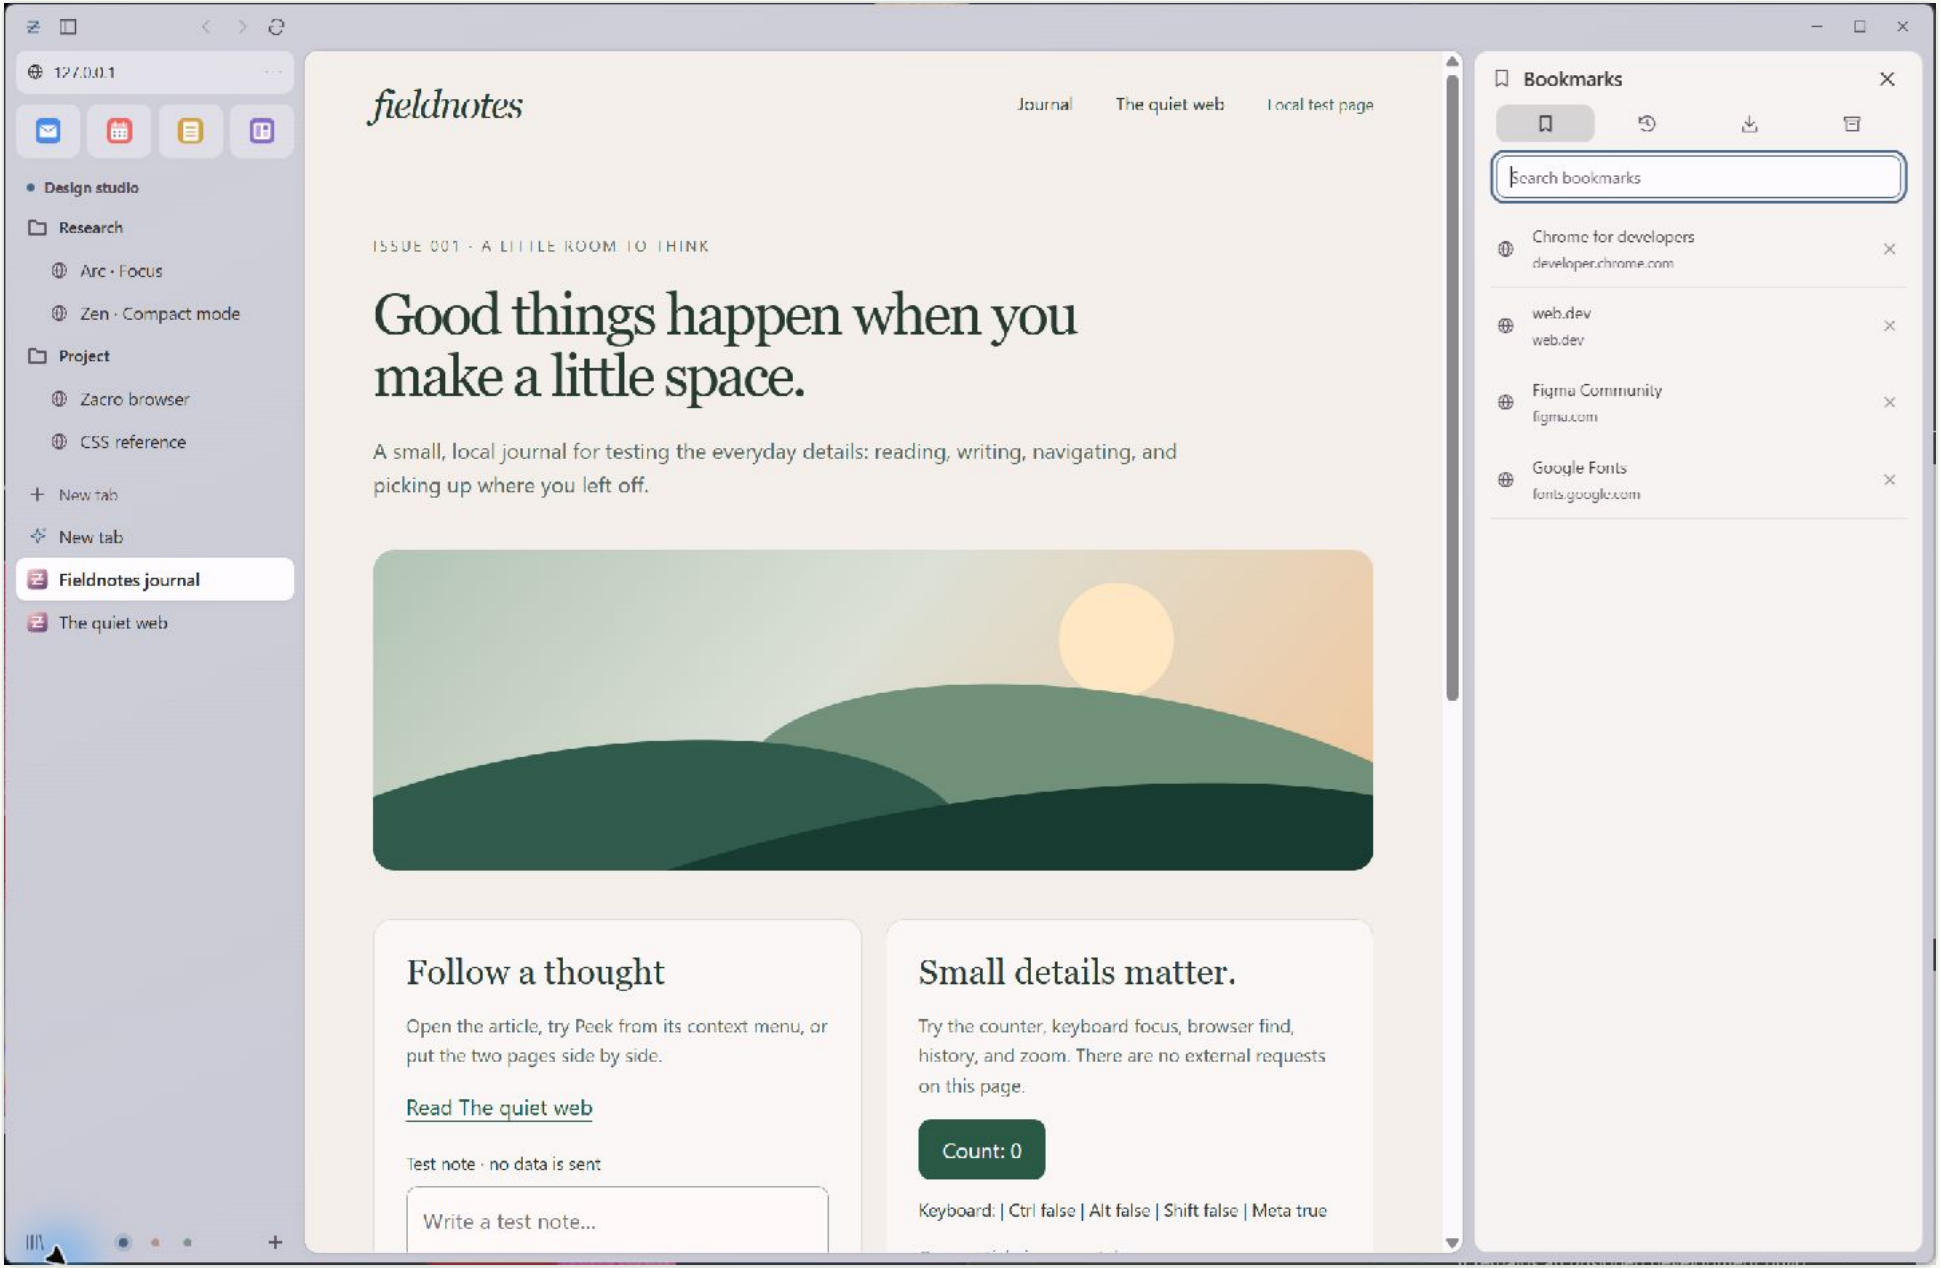

Alt + click or the link menu opens a live preview. Escape dismisses it. Promote it to a tab while preserving its draft, scroll position and navigation history.

Two pages, one workspace.

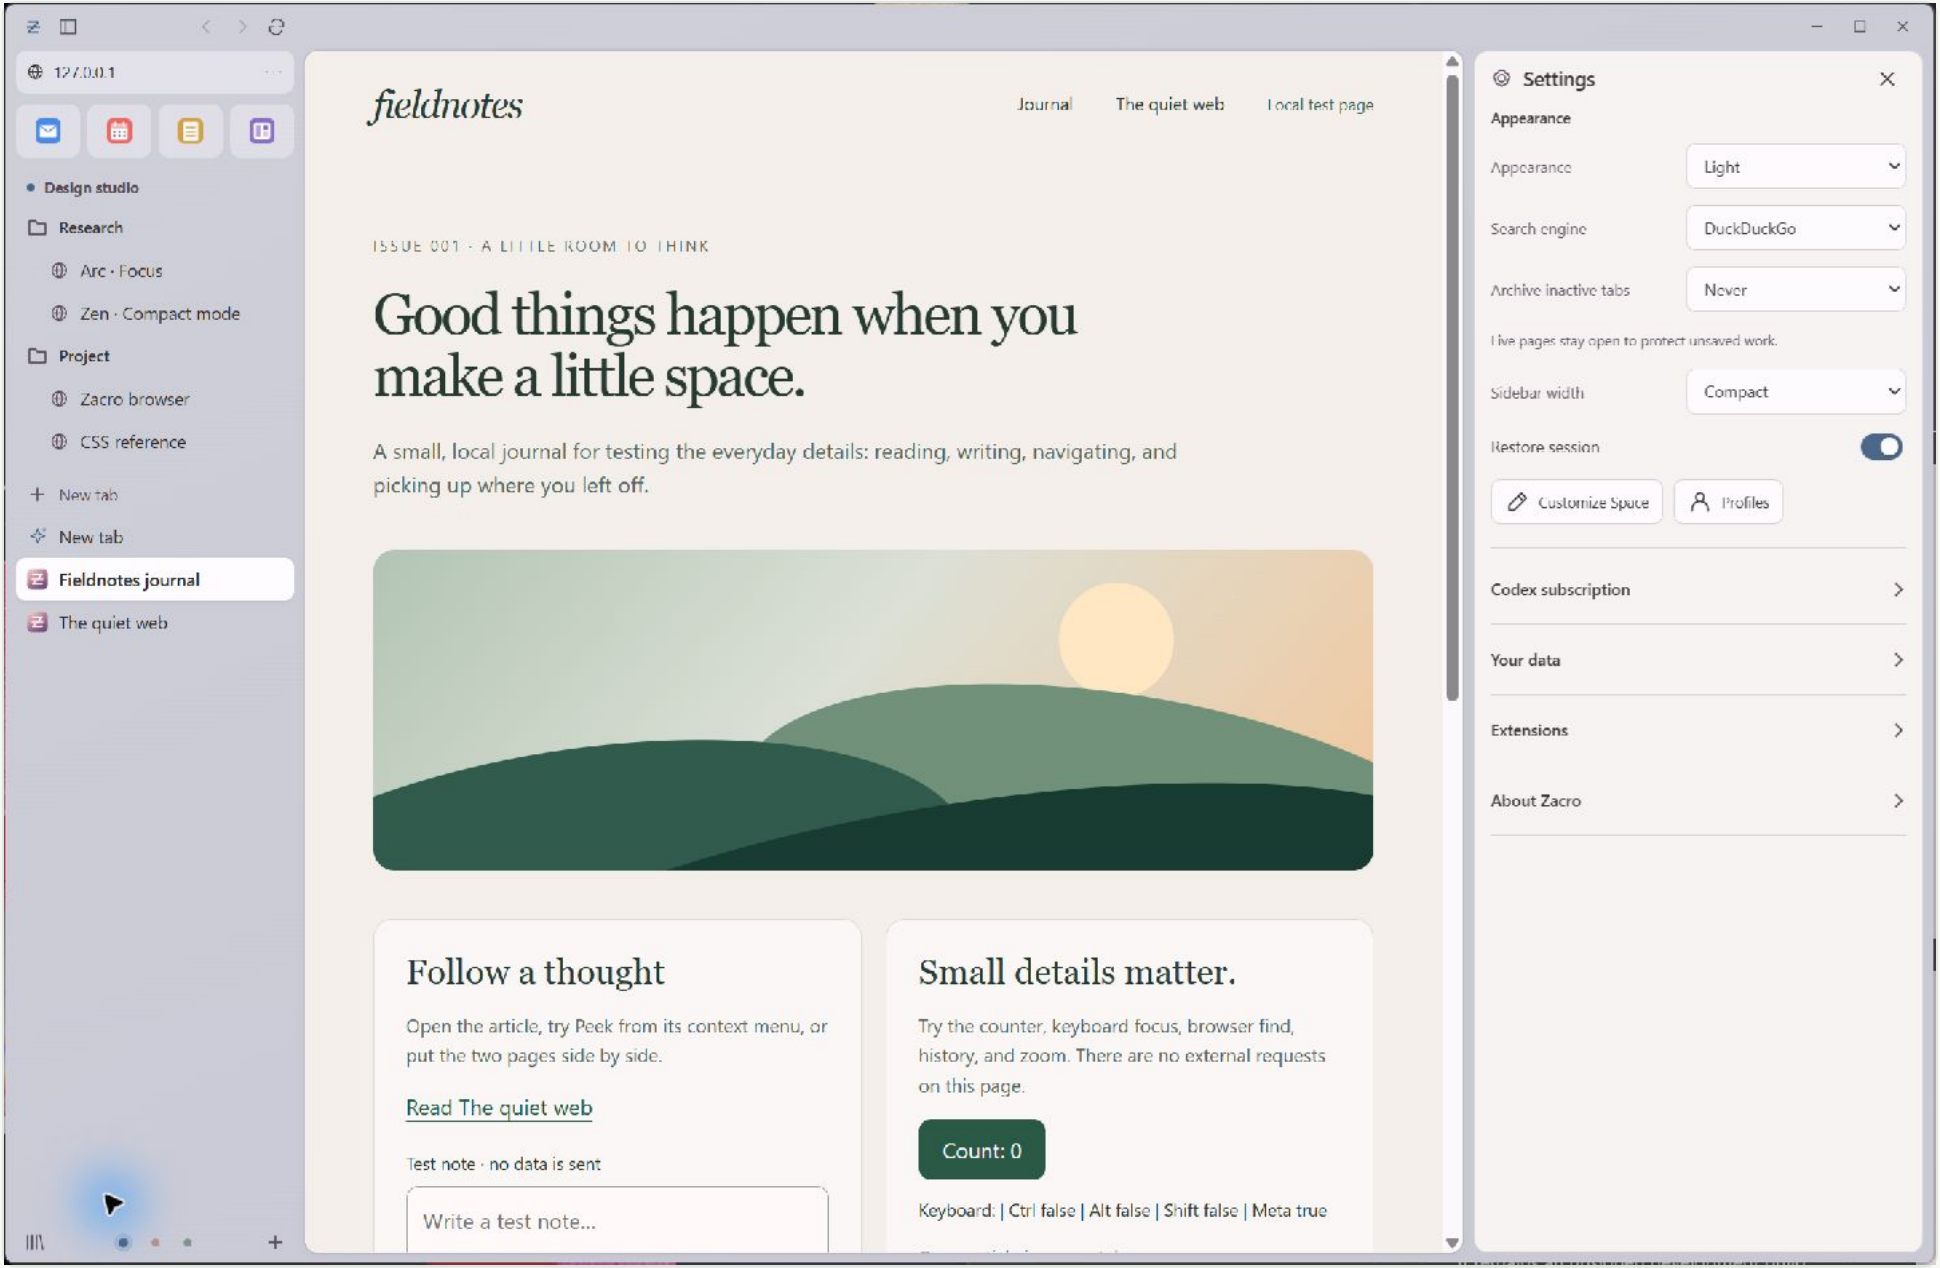

Compare or reference pages side by side. The address and navigation follow the focused pane while both pages keep their position and live state.

Find what you left behind.

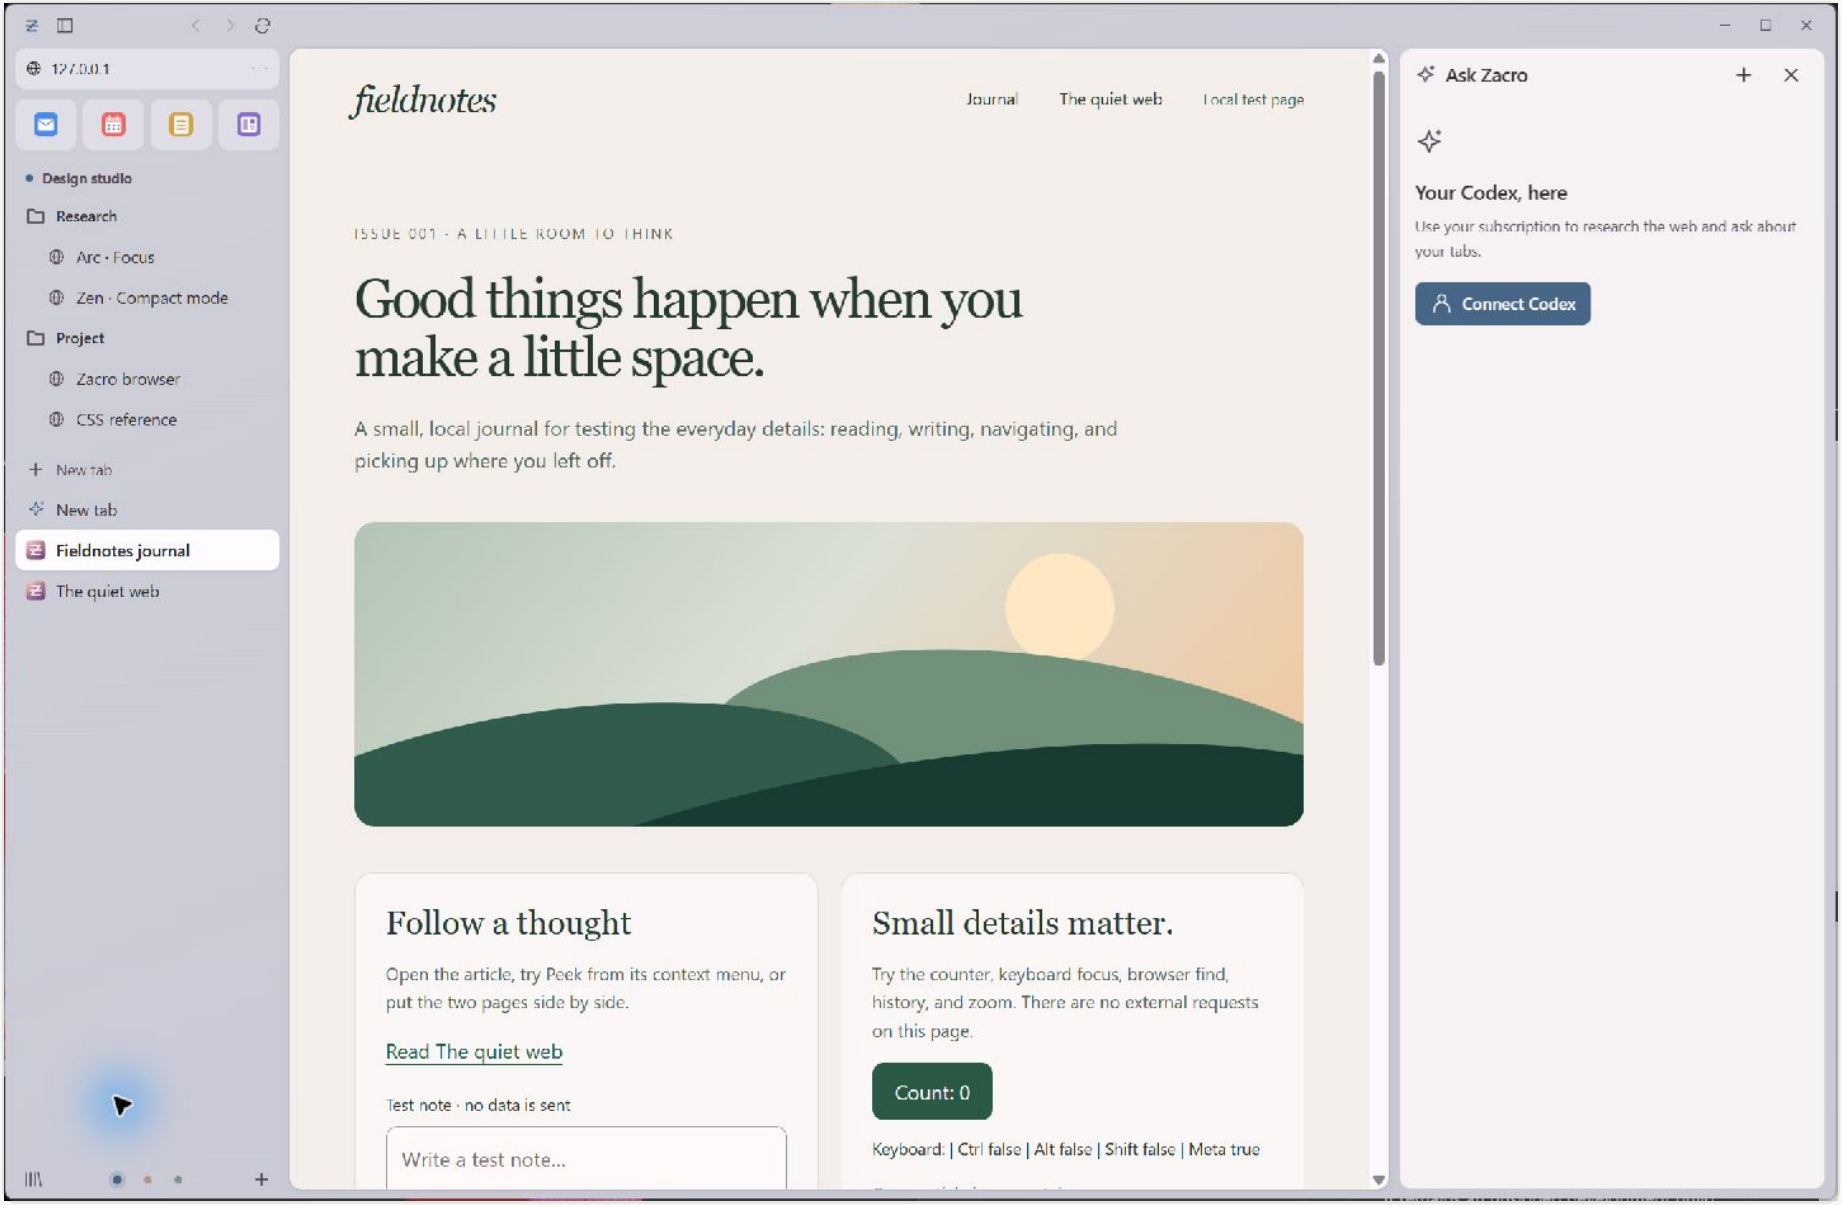

Bookmarks, history, downloads and archived tabs share one Library entry. Search within a section, switch sections, or return directly to your browsing.

Small controls. Useful choices.

Choose appearance, sidebar width and everyday behavior in Settings. Expand details when needed. Saved custom sidebar widths survive the compact layout update.

Your Codex subscription, in reach.

Connect Codex opens Settings, where Sign in with ChatGPT connects your subscription; no API-key or separate API billing. This capture is unconnected. Page sharing is explicit. Live account and inference acceptance remain open. This is a development build: sync, signed updates and commercial release gates remain unfinished. See README and docs/VALIDATION.md.
