Room for the page.

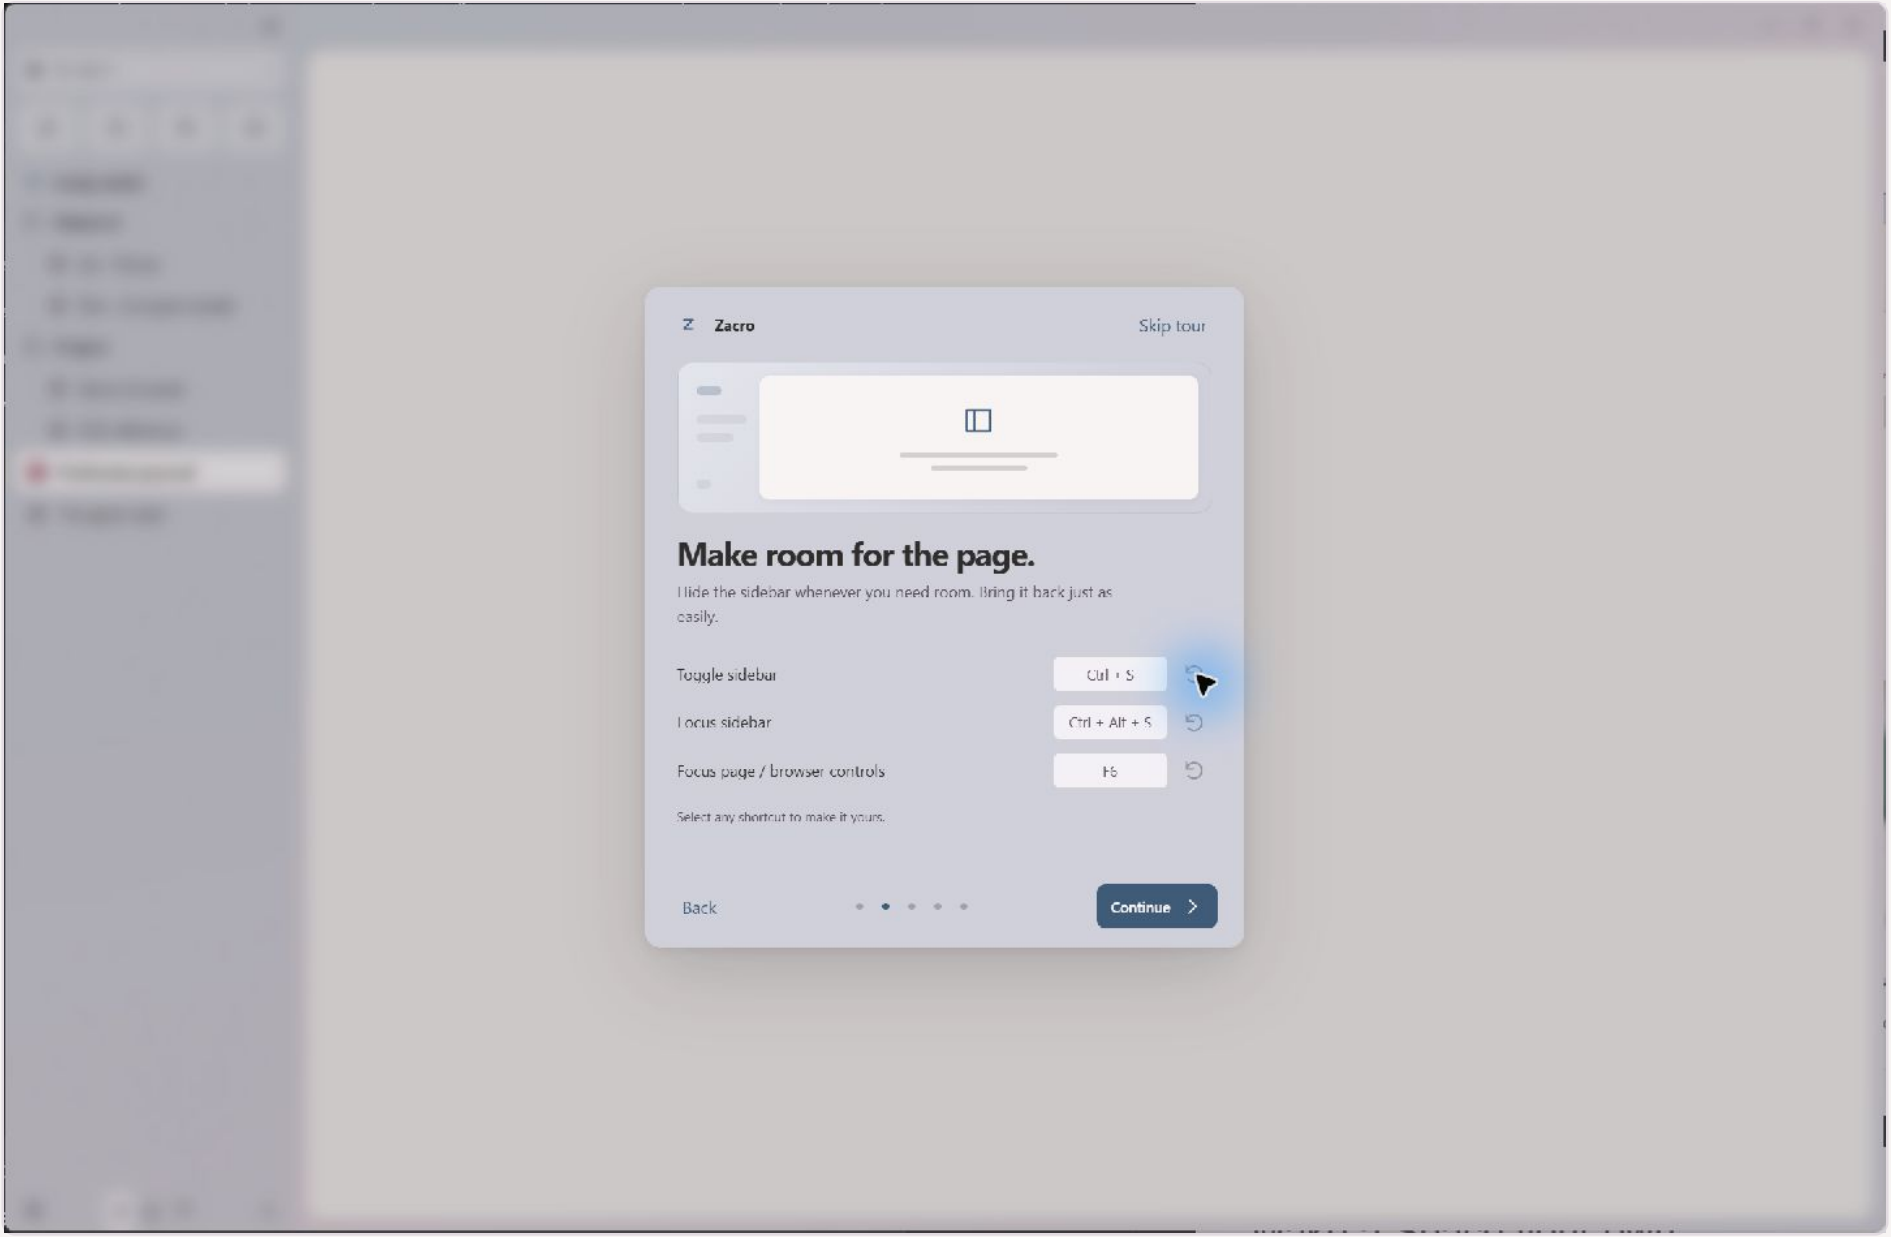

Navigation stays in the sidebar; the application logo, sidebar-toggle button and favorite status dots leave the chrome. Closing a favorite keeps its destination. Inactive favorites can sleep while active pages, drafts, media, downloads and live login callbacks remain protected.

Find it. Do it.

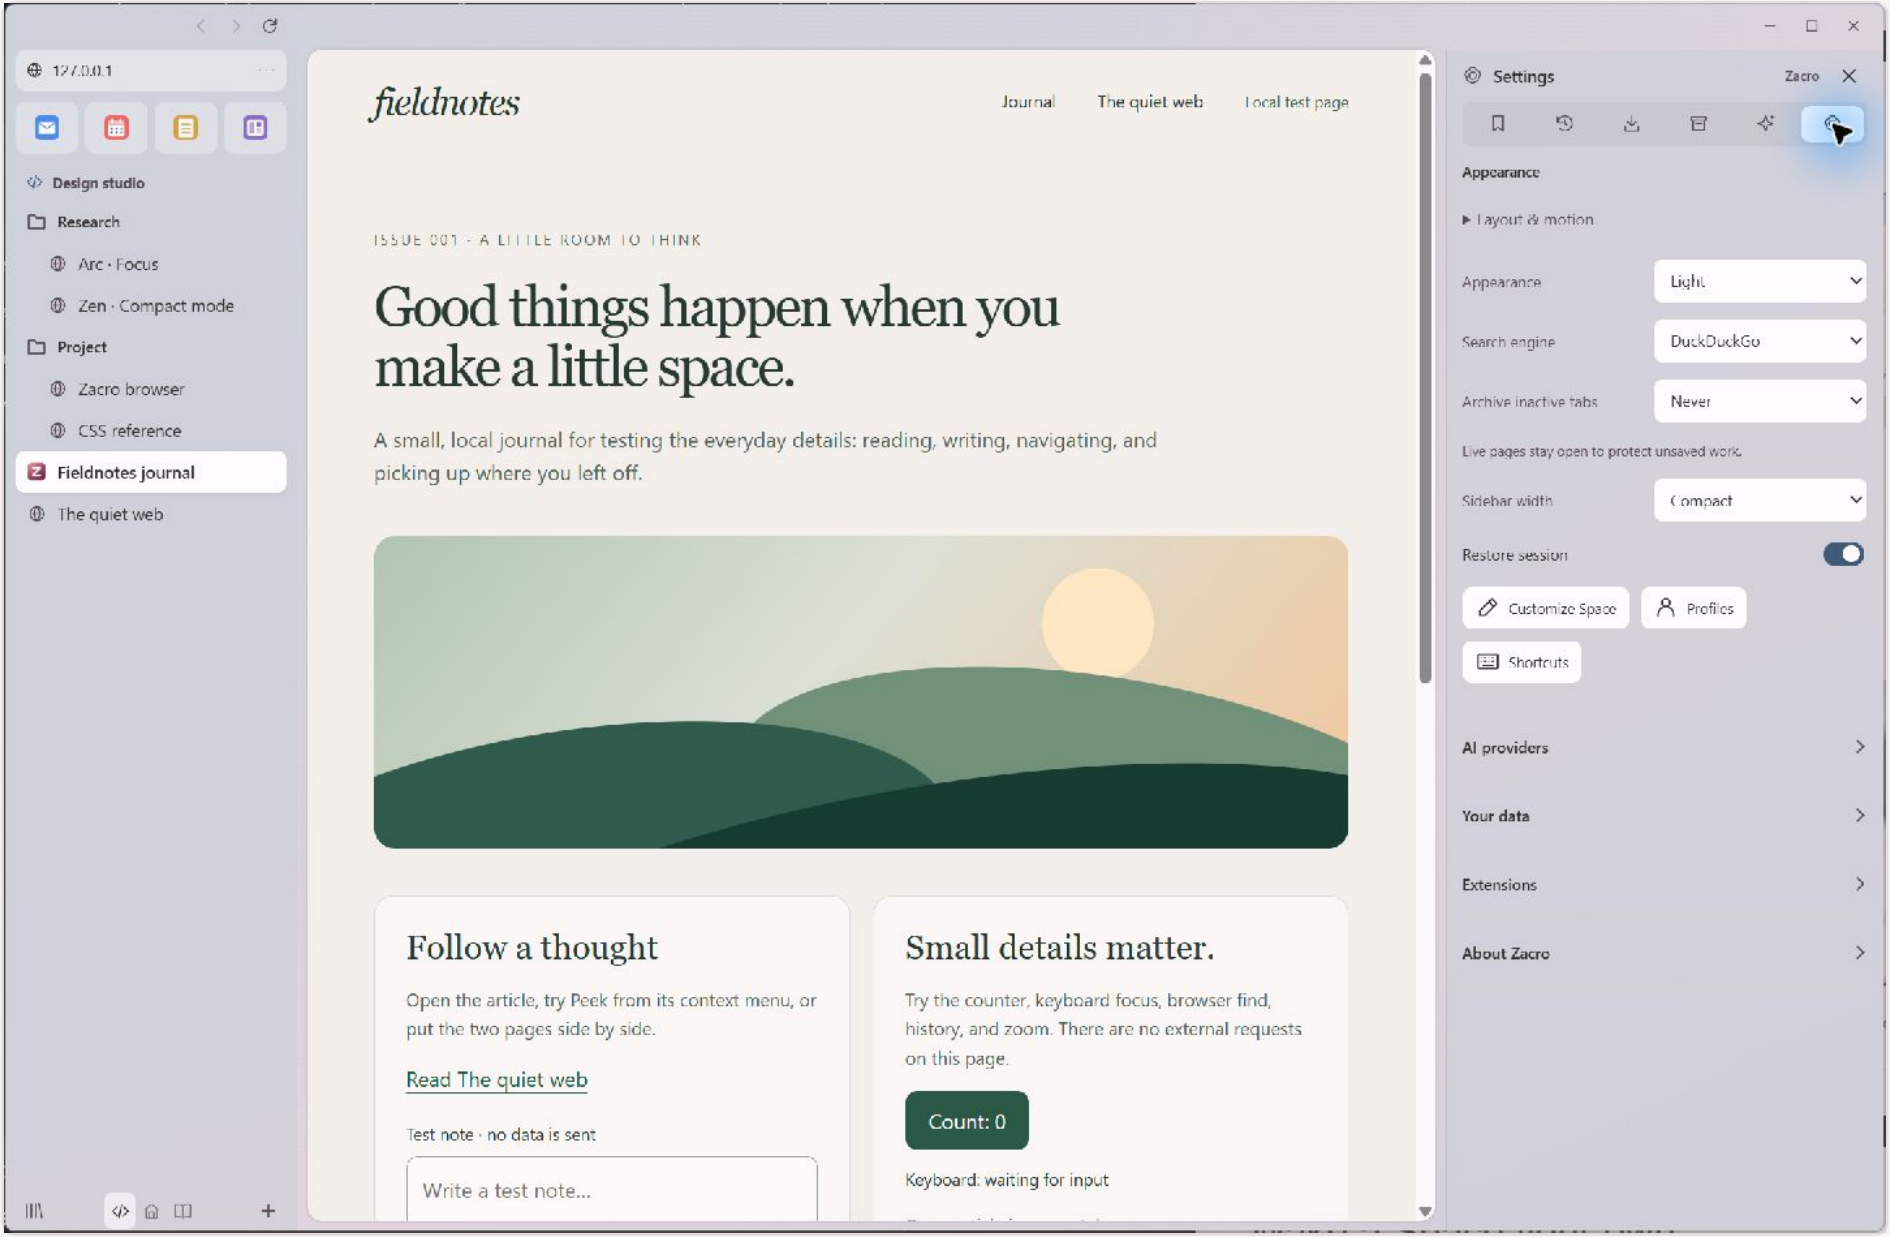

Filter tabs, Spaces, bookmarks, history and actions in one palette. Use @ for tabs, # for Spaces, or / for commands. Only the page blurs, inside its existing rounded frame; the sidebar remains usable. Opening the palette never creates a disposable tab.

Learn it. Make it yours.

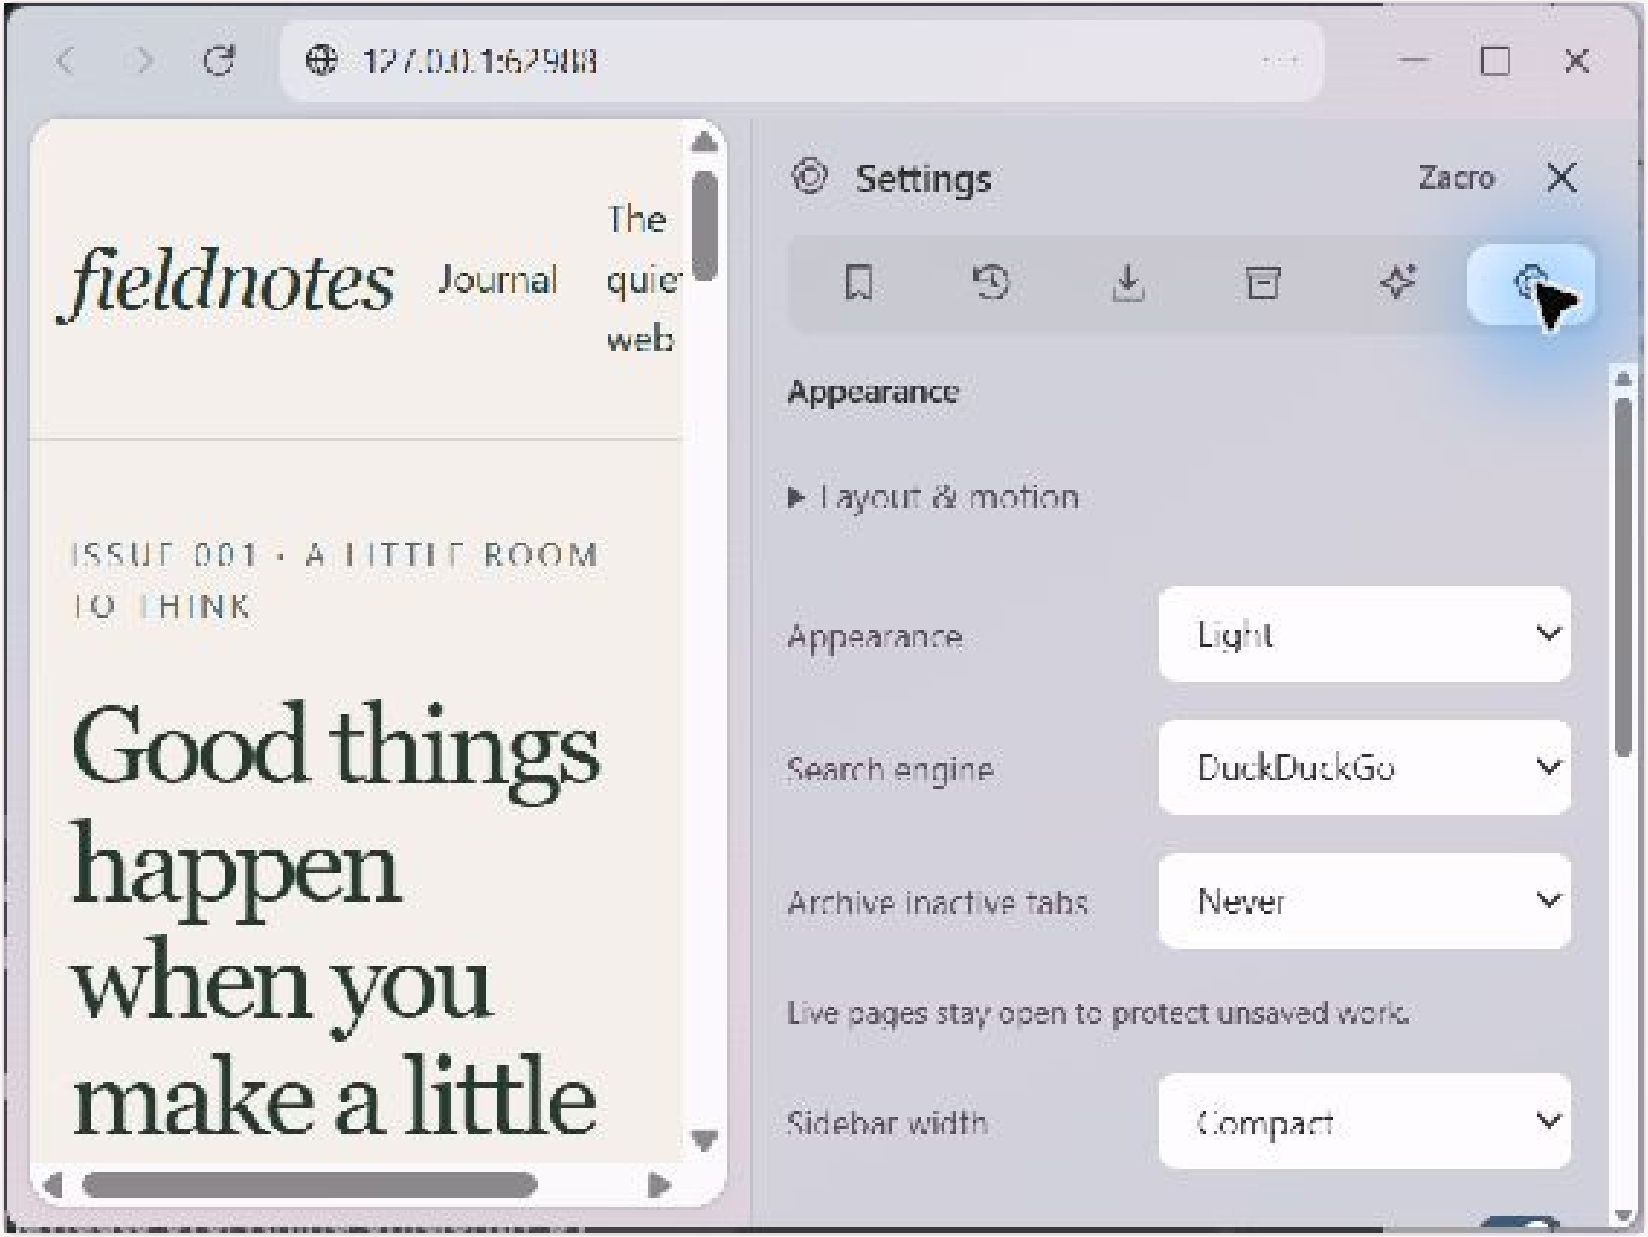

The five-step welcome tour introduces the command bar, sidebar, Spaces, favorites and settings. Every displayed shortcut is directly editable with conflict checks and a reset control. The same bindings drive menus and commands; the tour can be reopened at any time.

Part of the browser.

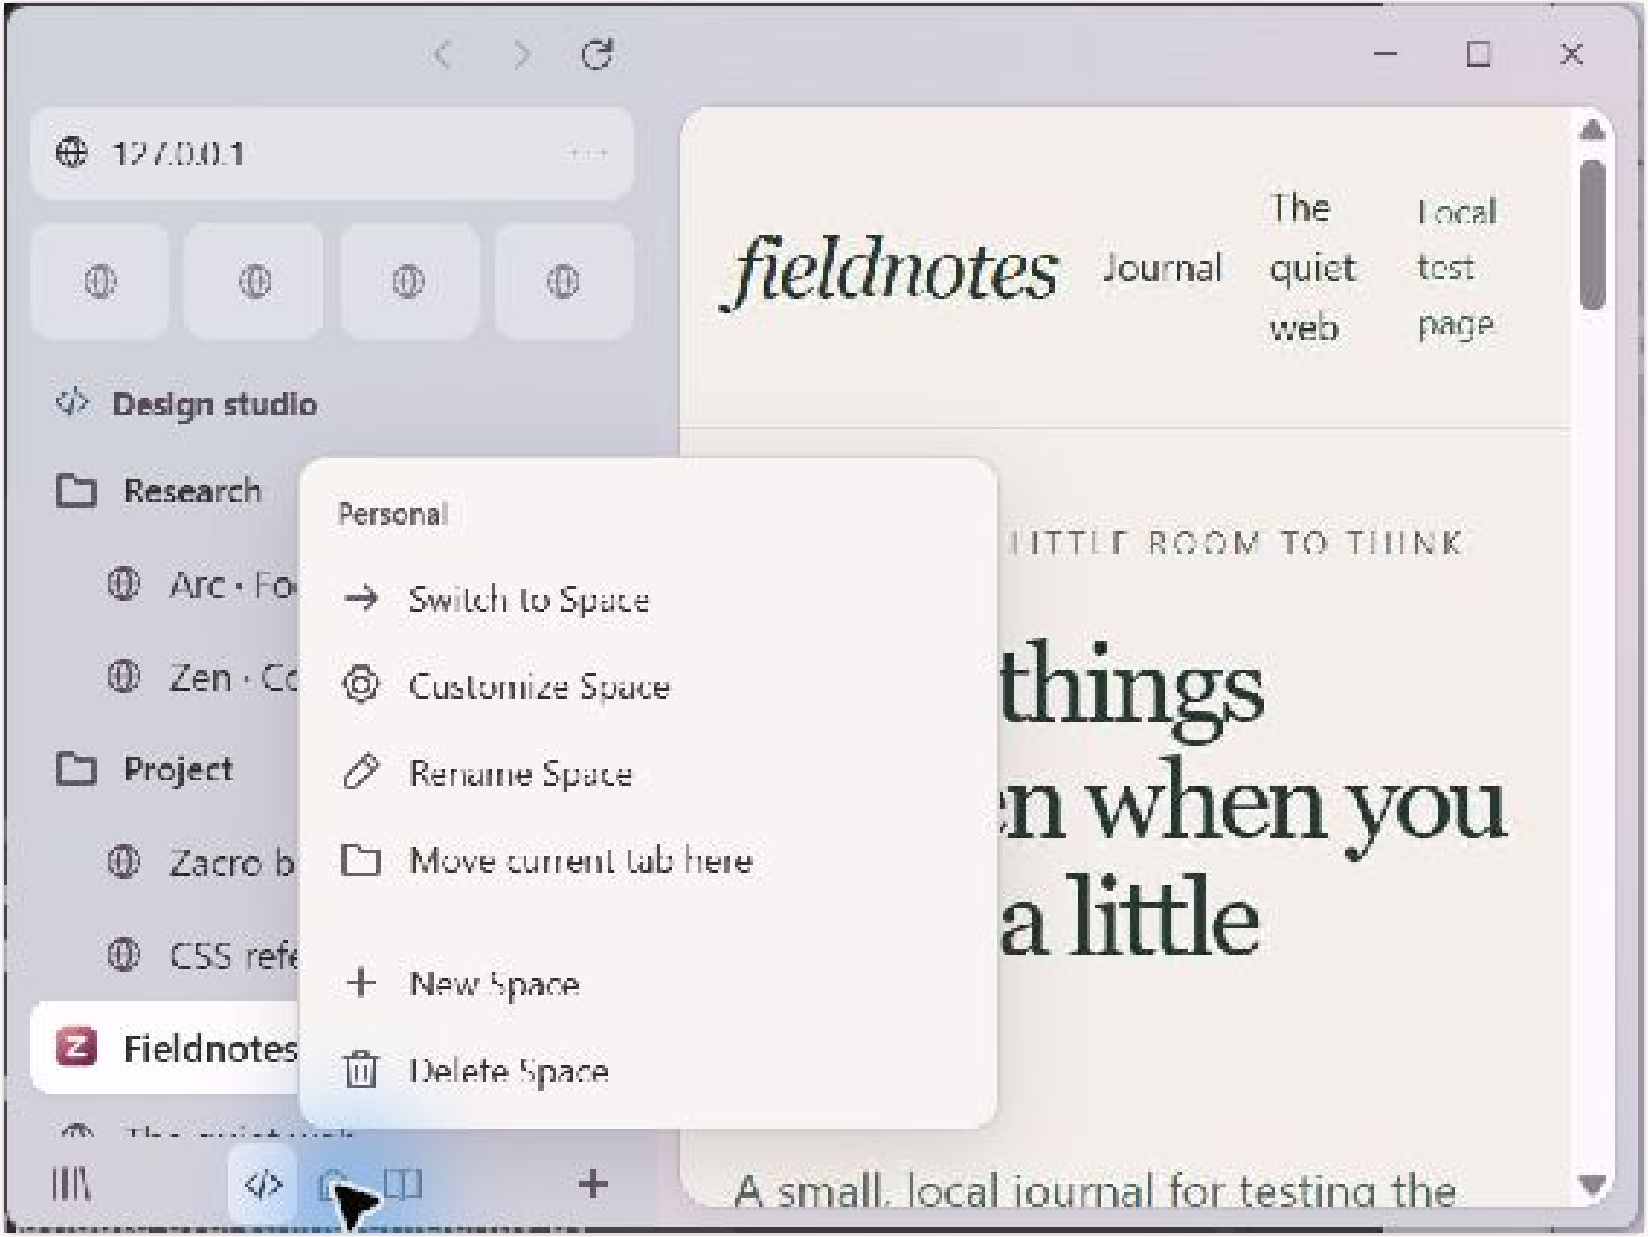

Library, Settings and the assistant belong to the Space-colored window, with their own divider and compact section navigation. Sidebar and panel widths share a 220 ms ease without spring overshoot. Library keeps the real page visible at its original rendering scale.

A smaller footprint.

The window supports sizes down to 560 by 420 logical pixels. Opening a browser panel makes room by temporarily hiding the sidebar, while retaining its saved width and visibility preference. Short dialogs and command results scroll to keep their controls reachable.

Everything in its place.

Right-click a Space or press Shift-F10 for its contextual actions. Sideways gestures reveal the neighboring Space's actual favorites, folders and tabs without a redundant name badge. Still captures do not establish motion quality; physical Mac and live Google acceptance remain open.
