A place for everything.

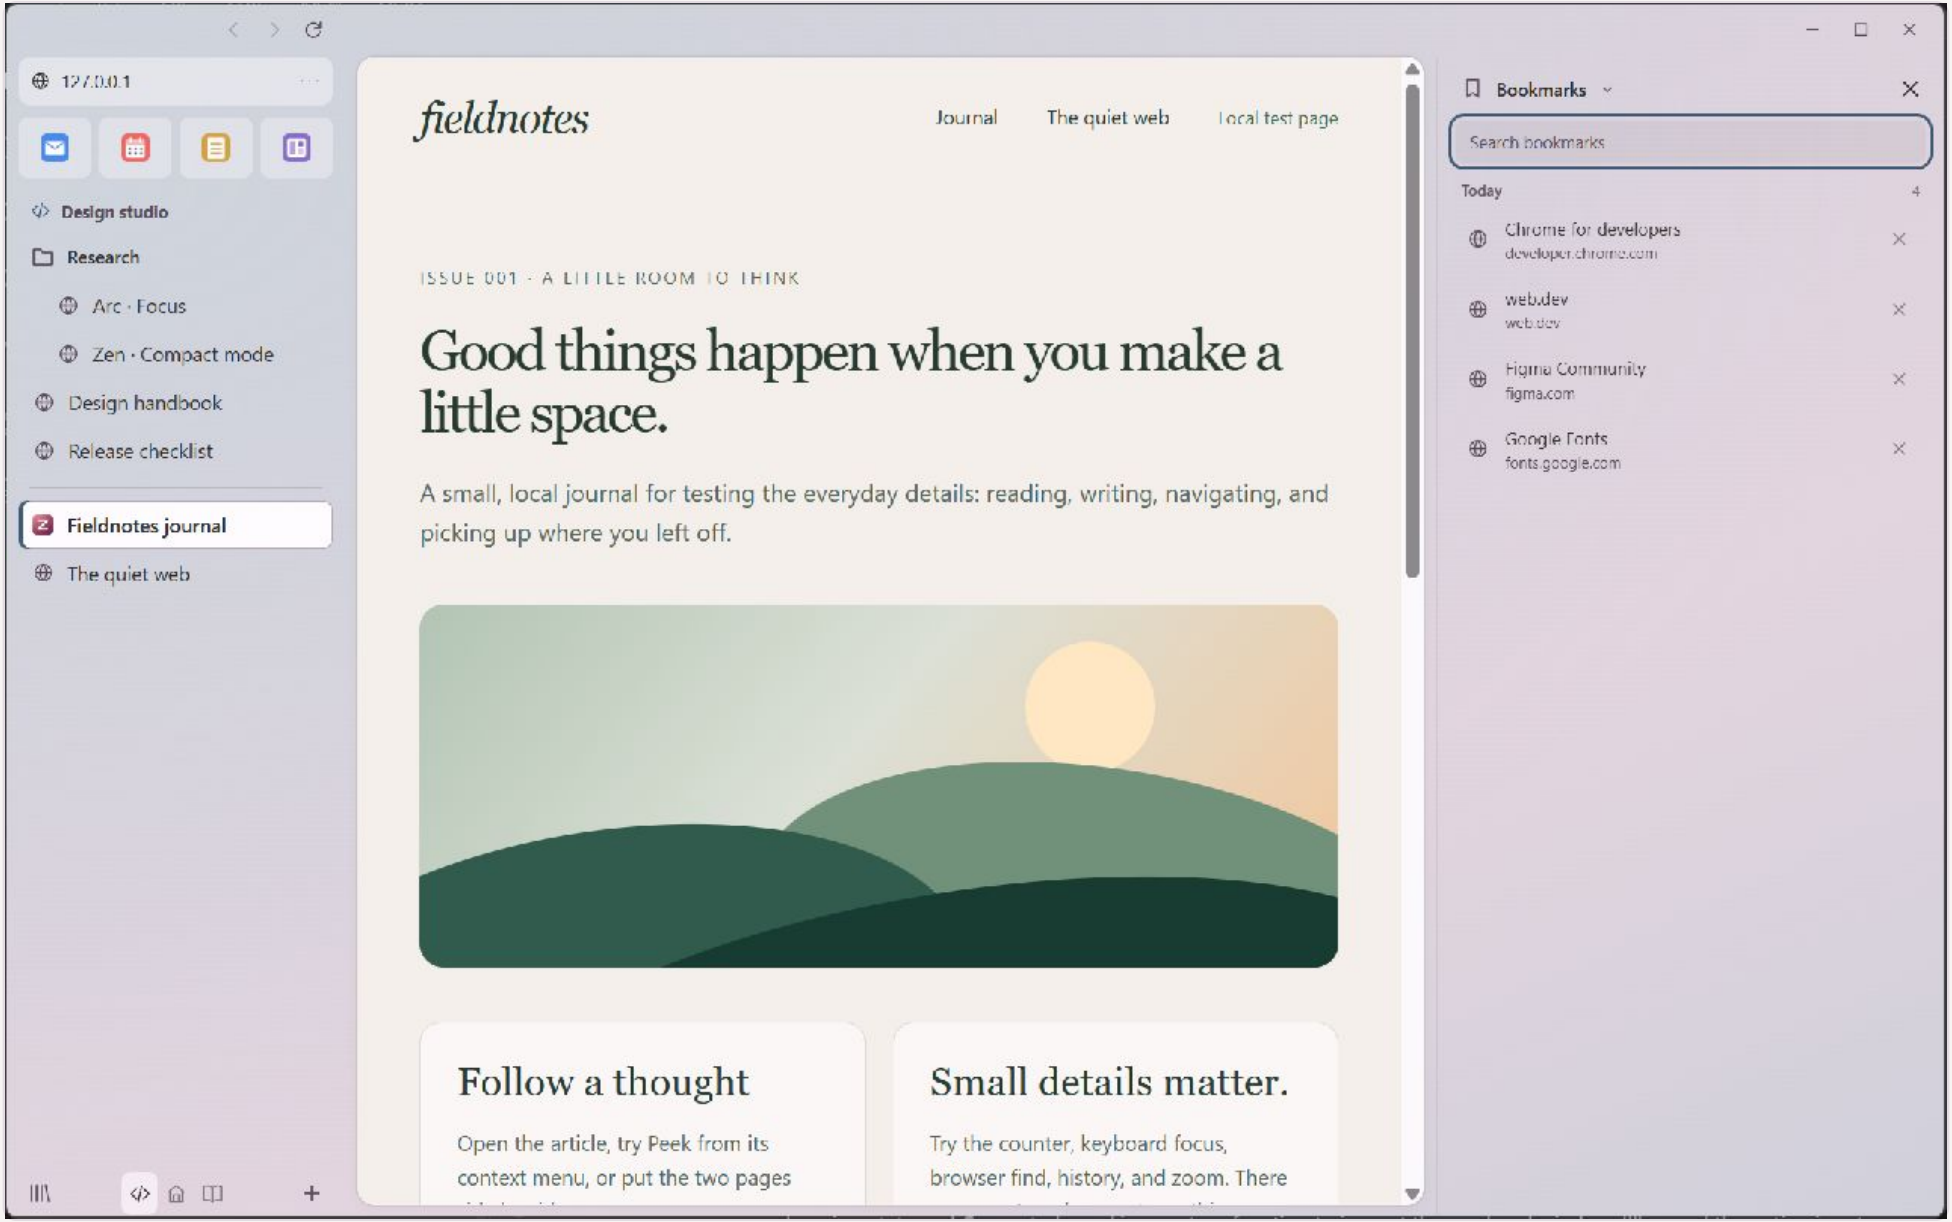

Profile-wide Favorites sit above saved Space pins, folders and ordinary tabs. The saved destination survives navigation and closing. Click a Favorite icon or pin favicon to return home; Replace Pin deliberately saves the current page. Drag between the three regions to reorganize a live tab.

Choose where to go.

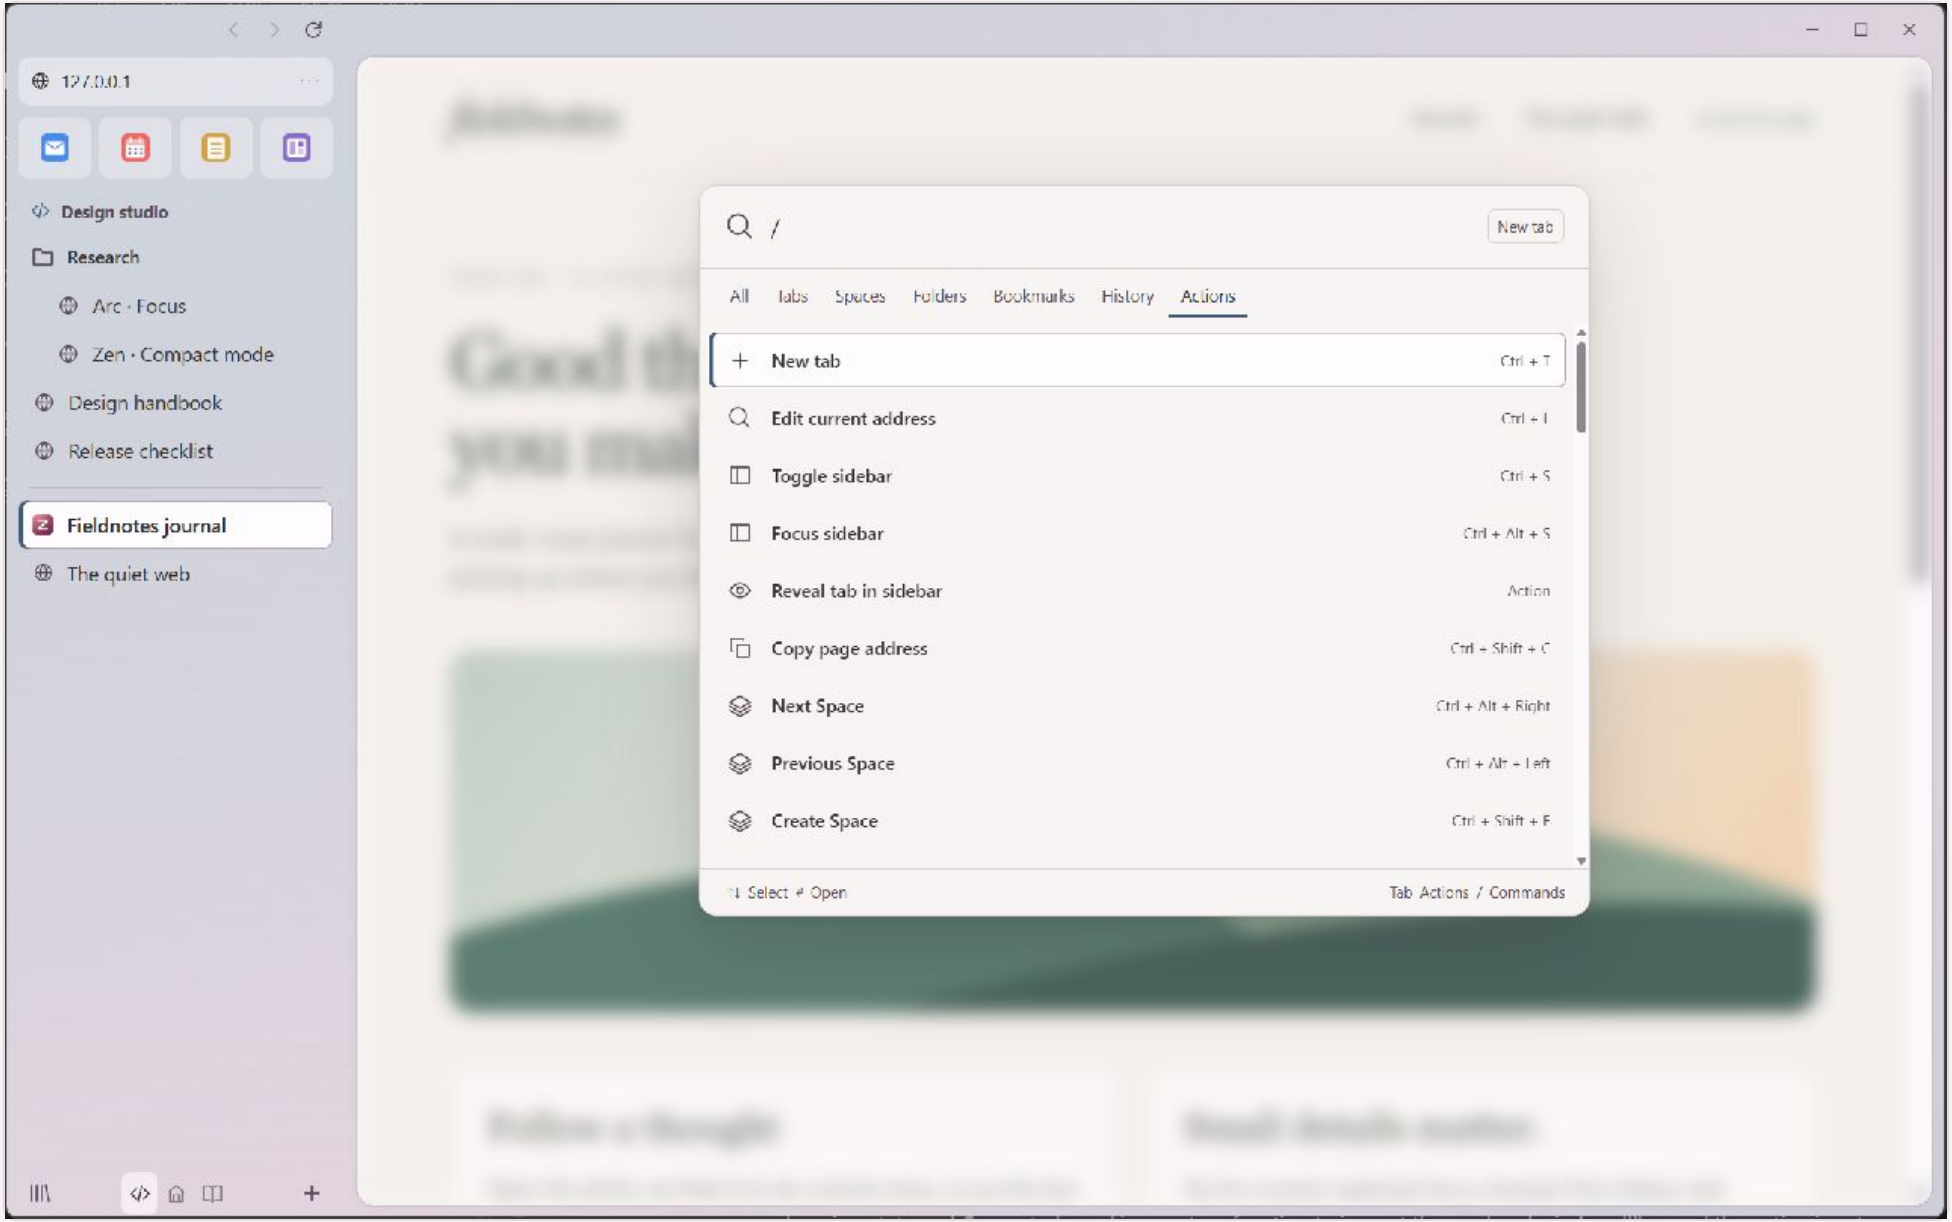

Library first offers named destinations in a compact menu. Arrow keys, typeahead and Escape keep it usable without a pointer. Opening the chooser leaves the live page visible, without capturing or changing its rendering scale.

One continuous window.

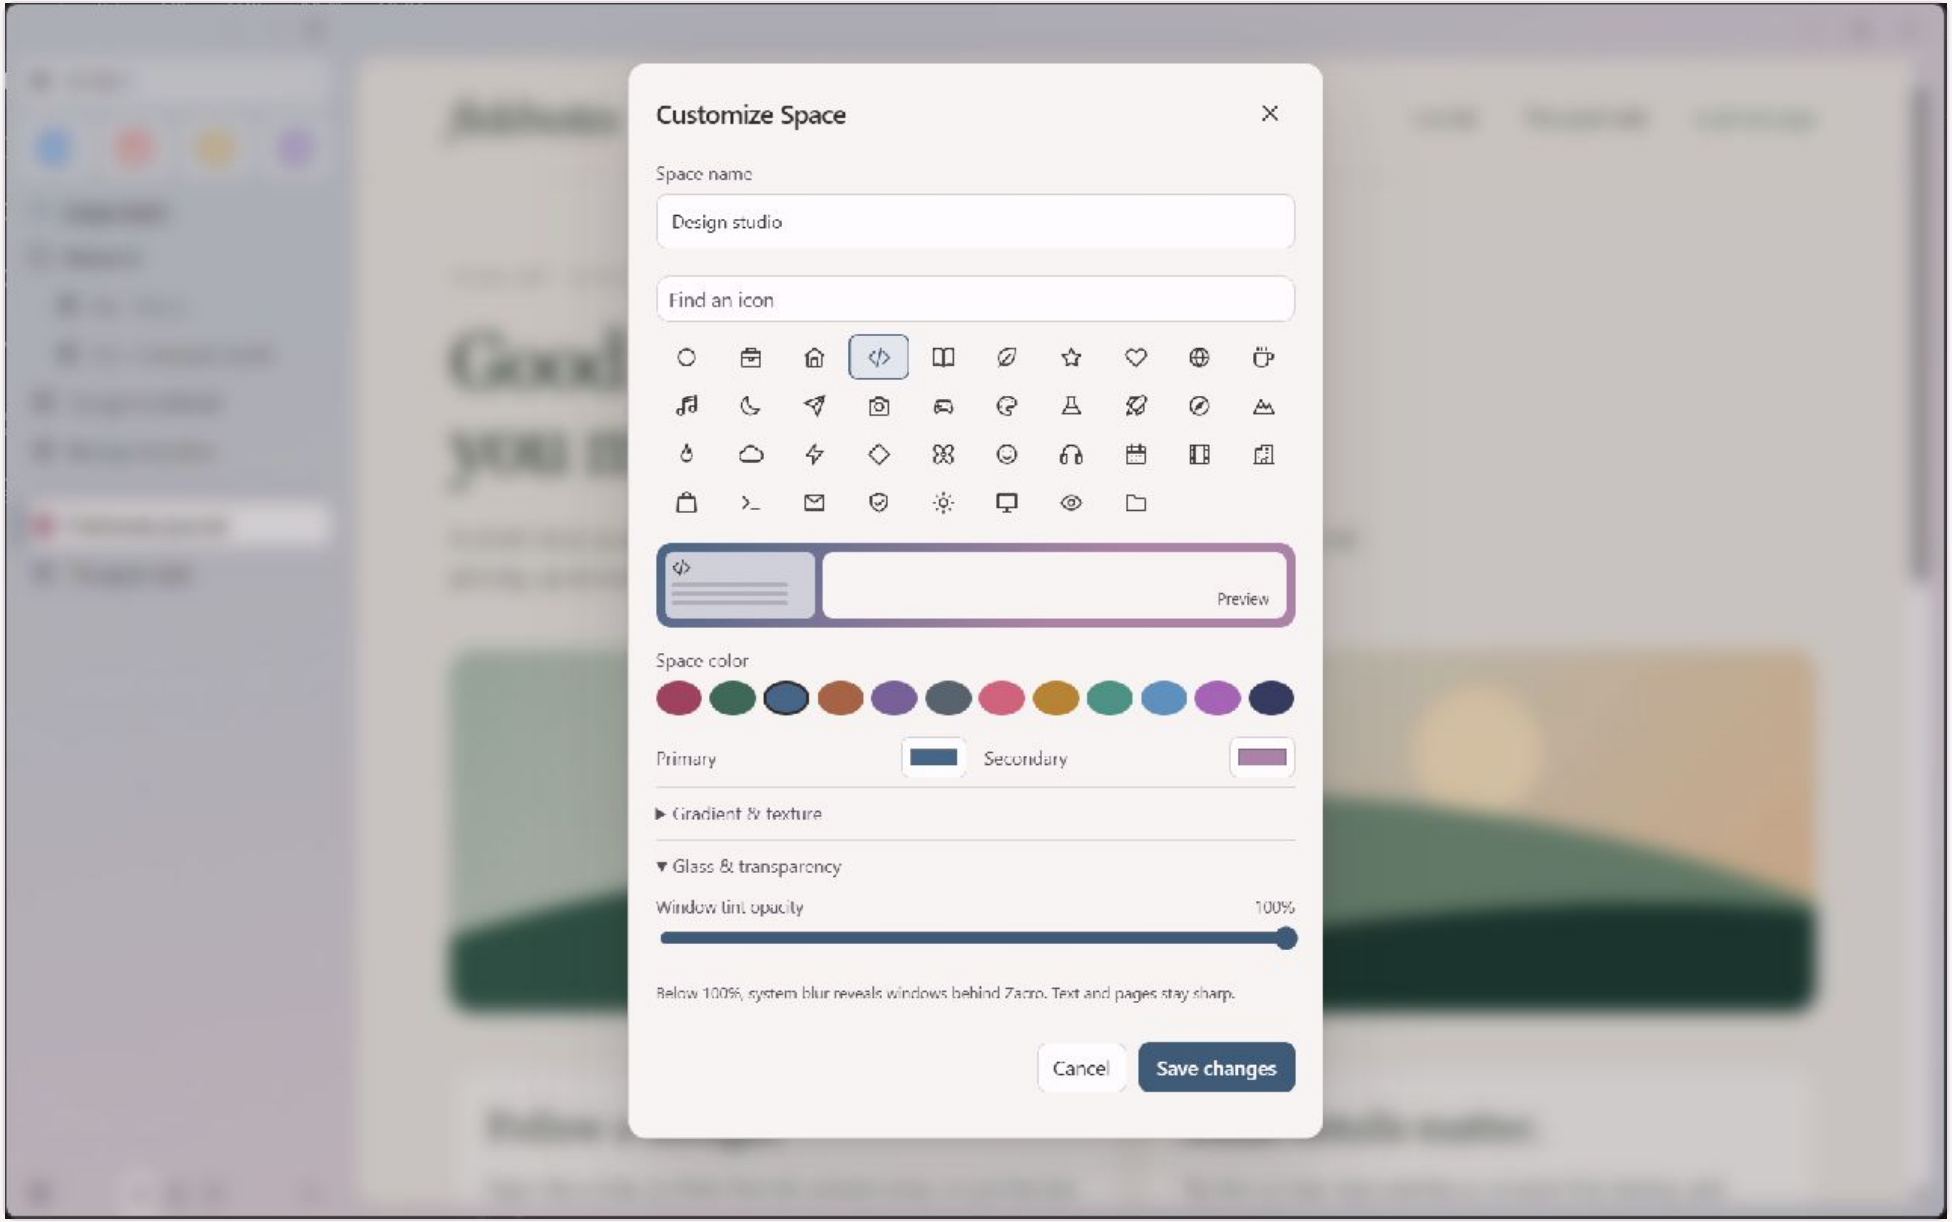

A single title chooser replaces the crowded section strip. Search, flat rows and date groups keep saved resources easy to scan. Drag either rail edge to resize, or focus the separator and use arrow keys. Native page bounds follow the change without reloading.

Find it. Then act.

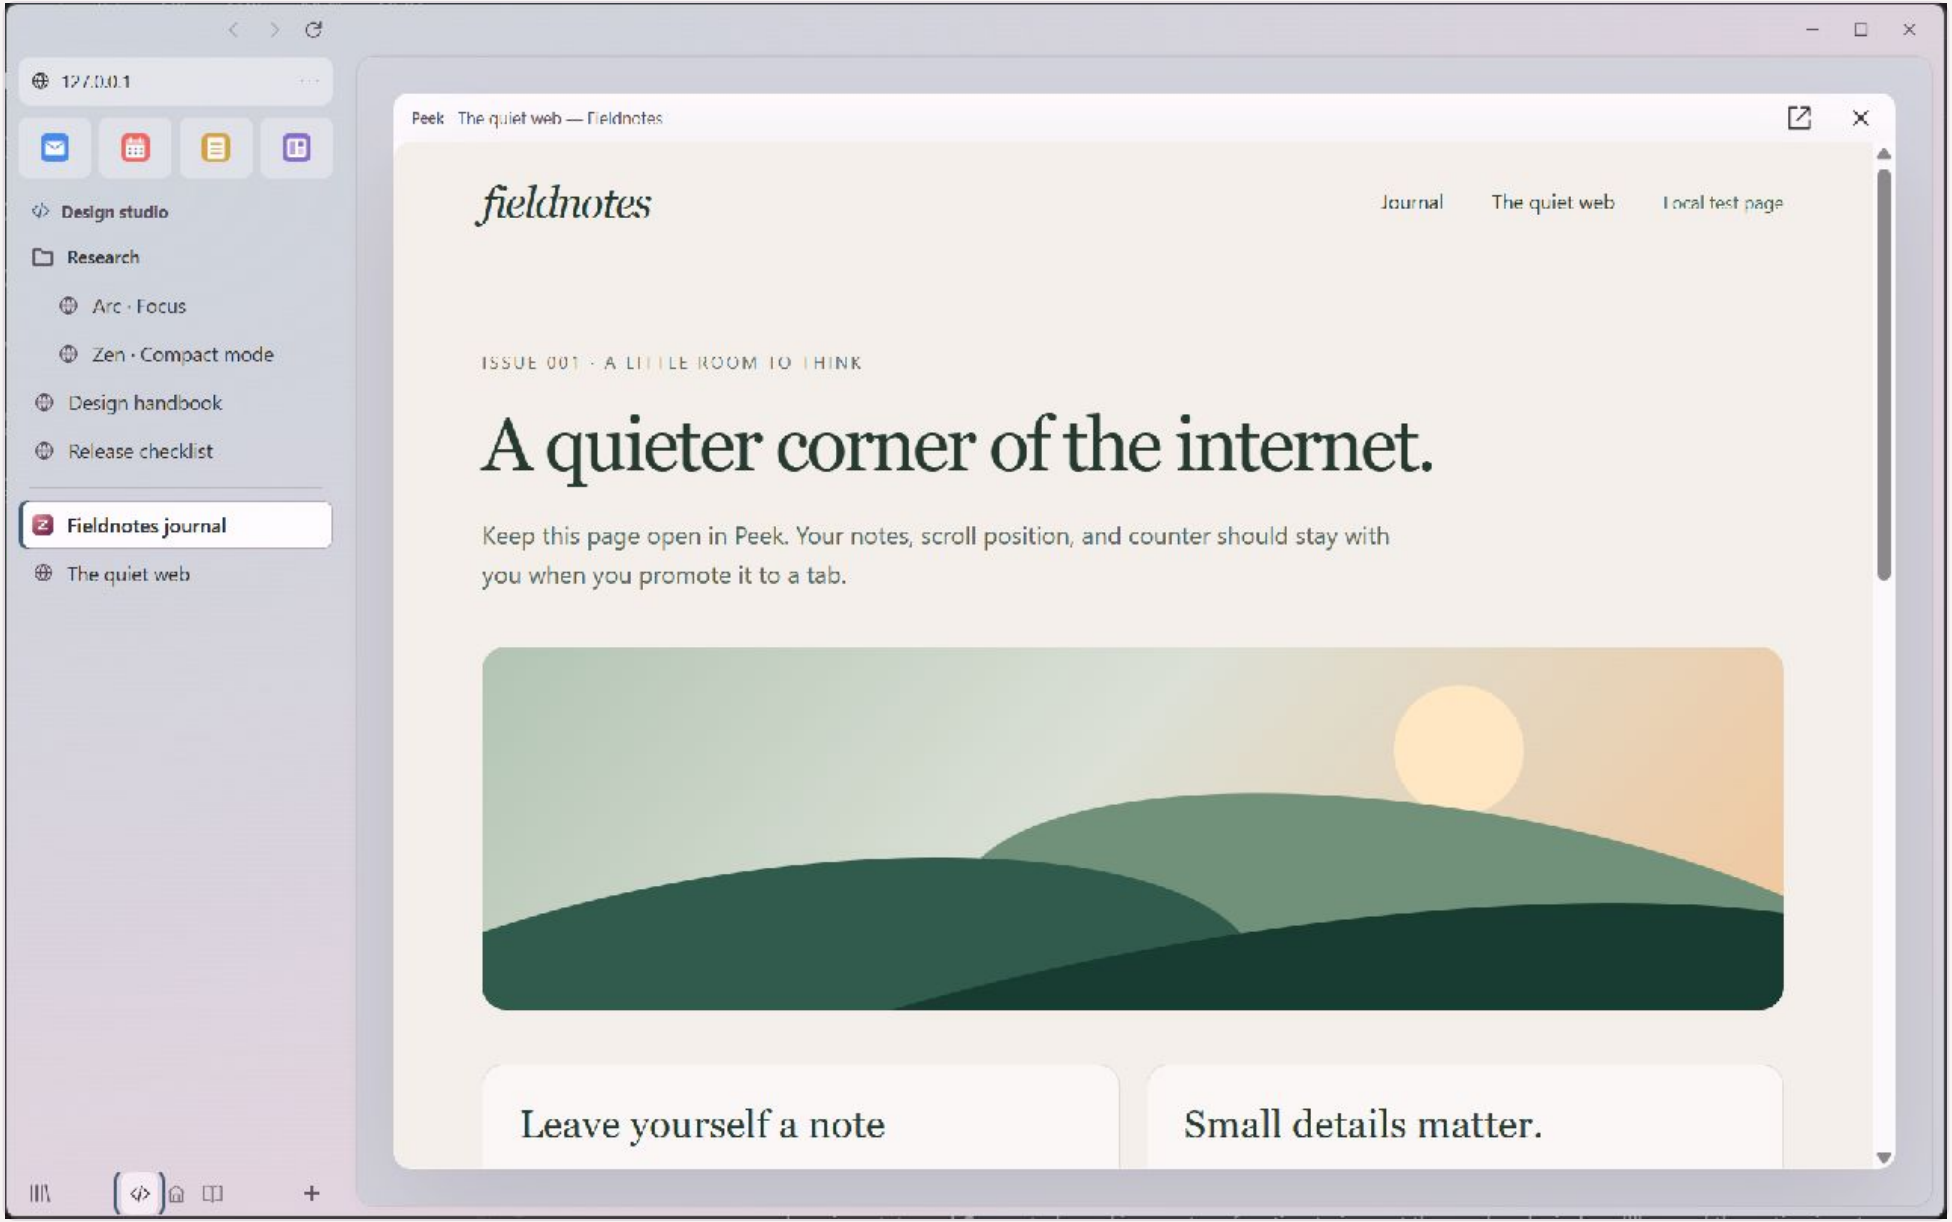

Find tabs, folders, Spaces, bookmarks, history and commands. Tab opens a result's actions and destination choices; Escape steps back. A configured site keyword followed by Tab enters Site Search. The palette opens without inserting a blank tab and blurs only the existing page frame.

Make room for your world.

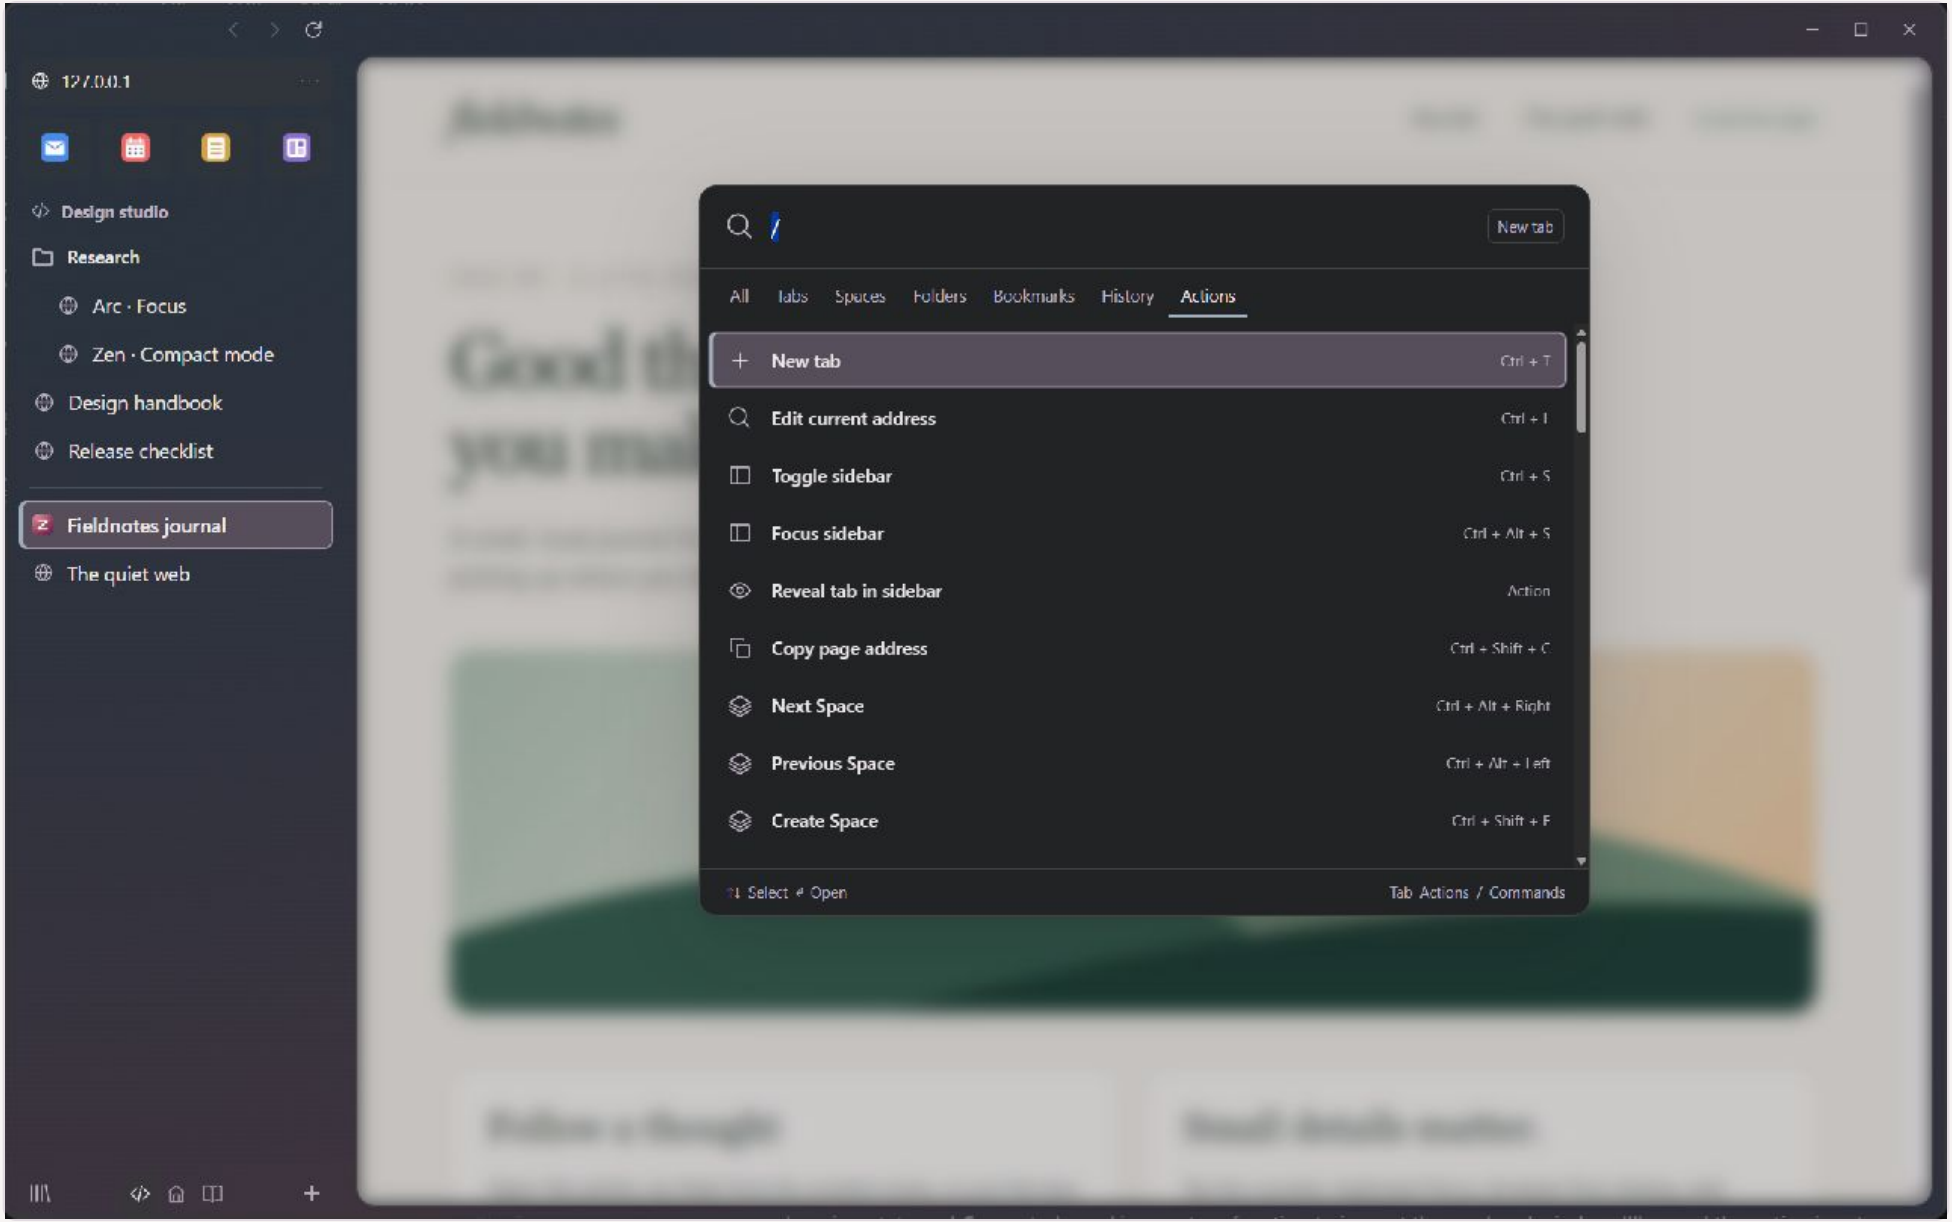

Choose from 38 searchable Space icons, two colors, gradient blend, grain and window tint opacity. Supported systems use desktop acrylic or behind-window vibrancy; blur strength follows the OS. Text and webpages remain opaque. Accessibility preferences can force opaque chrome.

Follow a link, stay here.

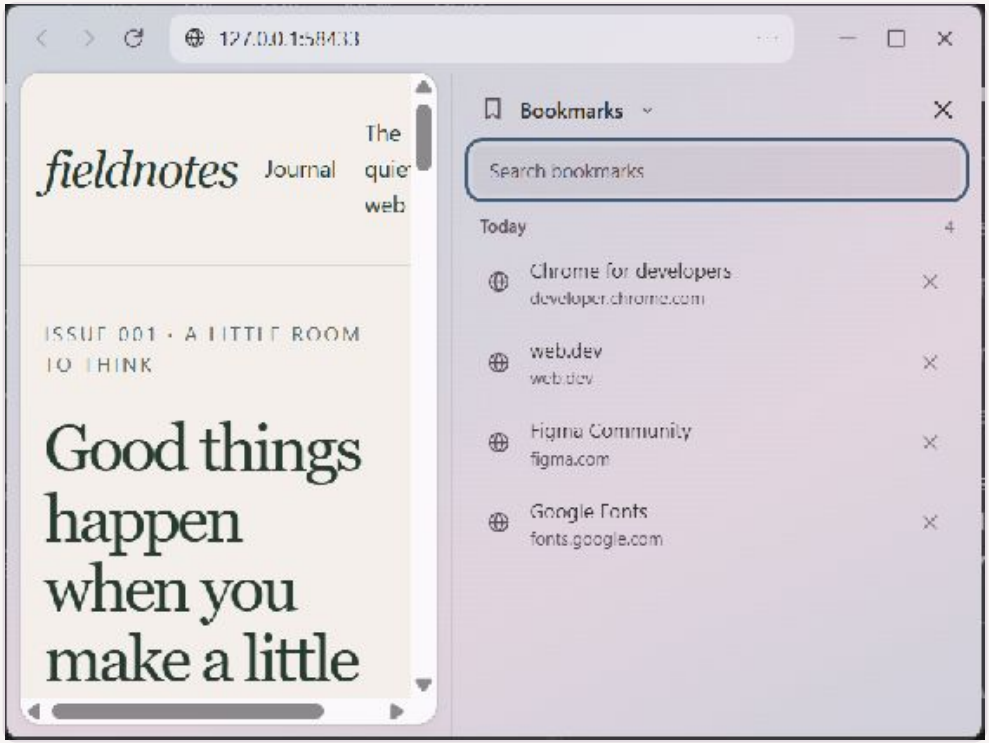

Shift-click a link to open Peek. Promote it to a full tab without replacing its document, or dismiss it to return to the original page. Trusted ordinary links from a saved pin to another hostname can also Peek; forms, redirects and explicit window semantics retain native behavior.

Selection you can see.

Selected rows and command results have a distinct fill, outline and accent edge. Focus remains visible in high contrast. Browser panels share the window's material, while the content page retains its own colors and rounded frame.

A smaller footprint.

The layout supports 560 by 420 logical pixels. Panels make room for a usable page and retain saved sidebar preferences. These original Windows captures use an instrumented local demo. Physical Mac input, live providers and commercial release gates remain open; Google account login is still blocked.
